

The choice between different types of lead screws and lead screw nuts available is generally made after taking into account the following factors.

Choice of the screw

Working environment

For work environments where there are no particular corrosive or oxidising agents our steel (L1320 and L1321) lead screws can be used.

Where these conditions are not met, we recommend using our stainless steel screws (L1322 and L1323) which are particularly suitable in the following cases:

- With a relative humidity of 70-80% and above.
- Immersed in water (including sea water).
- In the presence of particular corrosive agents such as chlorides. In case of highly corrosive agents please contact our Technical Department.
- In the food industry or pharmaceutical industry, where they are used with stainless steel or bronze nuts.
- Where the lead screws cannot be reached for lubrication. In particular, for lubricating "maintenance free" fittings they are coupled with plastic nuts.
- Where working temperatures are relatively high (above 200°C) - because stainless steel has a structure that is more suited to higher temperatures.

Backdrive

Irreversibility defines how much the nut can "backdrive" down the lead screw. If a nut cannot backdrive down the screw then it is irreversible. This is especially important if the lead screw and nut are being used in a vertical application i.e. in this situation no backdrive is normally acceptable.

Lead screws with a lead angle of <2° 30' are completely irreversible i.e., they cannot backdrive.

Lead screws with a lead angle >5° but <6° still have a good degree of irreversibility and may in some instances exhibit some backdrive.

Lead screws with a lead angle >6° have zero irreversibility, therefore the nut may backdrive down the lead screw with little or no load applied.

This is important to know in vertical applications.

Choice of the nut

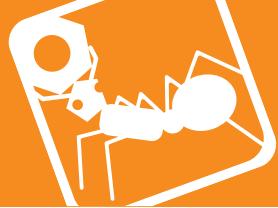

Working environment

Our bronze and stainless steel 303 lead screw nuts, are resistant to standard oxidizing agents that occur in various applications.

Where corrosive agents are present, please contact our Technical Department for advice.

In applications where the presence of added lubricant (grease or oil) is not allowed we recommend the use of self-lubricating plastic nuts.

The use of plastics can however be limited by the specific working conditions, therefore please consult our Technical Department should you wish. This is because plastics have excellent self-lubrication features, but at the same time have restrictions on the working temperature or moisture absorption problems, (as well as some mechanical properties that may not be suitable for the intended use).

Single start and double start

Pitch

The axial distance between threads. Pitch is equal to the lead in a single start screw.

Lead

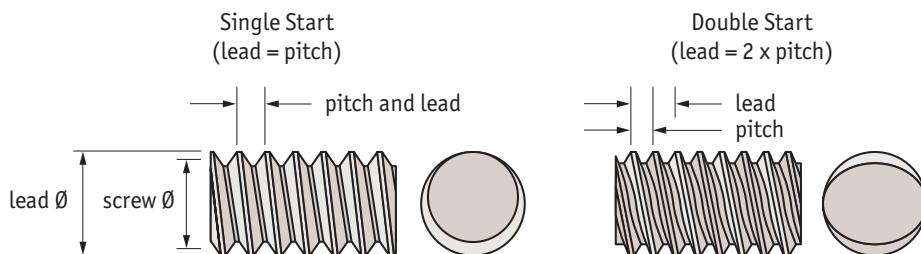

The axial distance the nut advances in one revolution of the screw. The lead is equal to the pitch times the number of starts.

$$\text{Lead} = \text{Pitch} \times \text{No. of starts}$$

For example: A 10mm diameter lead screw has a pitch of 2mm. On a single start lead screw the lead is also 2mm. On a twin start lead screw the lead is 4mm.

Screw starts

The number of independent threads on the screw shaft, example one or two.

Straightness

Automotion Components lead screws are produced with controlled straightness.

Screw straightness is checked by measuring the variation of the deflection f , when the screw is supported at the ends on two fixed points and slightly rotated.

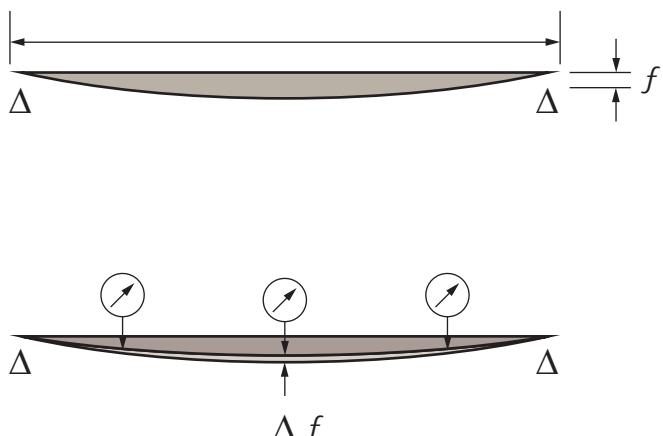

For example, the screw L1320.R30-06 has a straightness of 0.2 mm over 300 mm.

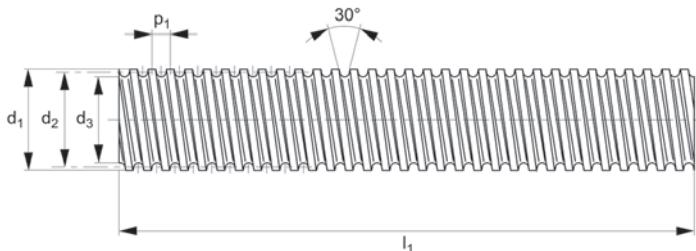

This means that a screw 30x6 300 mm long resting on two fixed points at the ends and rotated slightly displays a camber variation Δf less than 0.2 mm at all points on the screw.

Straightness

Δf = lead screw weight camber.

Good screw straightness gives operation with load always centred on the axis, hence uniform distribution of surface contact pressure between screw and nut. This allows smooth running and a regular rotation.

L1320

Material

Rolled trapezoidal thread, steel EN 10083-2 (C35, DIN 1.0501) or (C45, DIN 1.0503).

Manufactured to ISO 2901/2903 (DIN 103).

Surface hardness approx. 250HB.

Select a suitable lead screw nut (part nos. L1330 to L1343) to suit the lead screw - the most popular nuts are the flanged, bronze nuts part no. L1331.

Single start lead screws are less expensive than twin start lead screws.

see part no. L1321.

For stainless steel right hand lead screws see part no. L1322.

Cutting to required length and machining of ends - on request.

Lead screw lengths of up to 6 metres can be provided for a diameter >30mm.

Technical Notes

'Lead' refers to the distance that a nut will travel for a complete revolution of the screw.

Tips

These are the standard right hand thread lead screws - for left hand thread versions

L1321

Material

Rolled trapezoidal thread, steel EN 10083-2 (C35, DIN 1.0501) or (C45, DIN 1.0503). Manufactured to ISO 2901/2903 (DIN 103). Surface hardness approx. 250HB.

Select a suitable lead screw nut (part nos.

L1330 to L1343) to suit the lead screw - the most popular nuts are the flanged, bronze nuts part no. L1331.

Single start lead screws are less expensive than twin start lead screws.

no. L1320.

For stainless steel left hand lead screws see part no. L1323.

Cutting to required length and machining of ends - on request.

Lead screw lengths of up to 6 metres can be provided for a diameter >30mm.

Technical Notes

'Lead' refers to the distance that a nut will travel for a complete revolution of the screw.

Tips

These are left hand thread lead screws - for the standard right hand threads see part

L1322

Material

Rolled trapezoidal thread, stainless steel (AISI 316L, A4). Resistant to nearly all types of corrosion (can be used in a wet or corrosive environment). Manufactured to ISO 2901/2093, DIN103.
Surface hardness approx. 280HB.

travel for a complete revolution of the screw.

Select a suitable lead screw nut (part nos. L1330 to L1343) to suit the lead screw - the most popular nuts are the flanged, bronze nuts part no. L1331.

For left hand stainless steel threads see part no. L1323.

Cutting to required length and machining of ends - on request.

Lead screw lengths of up to 6 metres can be provided for a diameter >30mm.

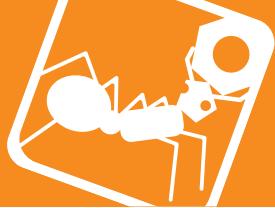

Tips

Technical Notes

'Lead' refers to the distance that a nut will

Right hand thread lead screws are standard.

LEAD SCREWS & NUTS

L1323

Material

Rolled trapezoidal thread, stainless steel (AISI 316L, A4). Resistant to nearly all types of corrosion (can be used in a wet or corrosive environment). Manufactured to ISO 2901/2093, DIN103.
Surface hardness approx. 280HB.

travel for a complete revolution of the screw.

Select a suitable lead screw nut (part nos. L1330 to L1343) to suit the lead screw - the most popular nuts are the flanged, bronze nuts part no. L1331.

lead screws.

For the standard right hand threads in stainless steel see part no. L1322. Cutting to required length and machining of ends - on request. Lead screw lengths of up to 6 metres can be provided for a diameter >30mm.

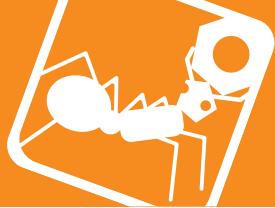

Technical Notes

'Lead' refers to the distance that a nut will

Tips

These are stainless steel left hand thread

L1330

Material

Bronze (CuSn7ZnPb). To ISO 2901/2903 and DIN 103.

Technical Notes

For manual or powered applications at low

and medium rotation and under loads.

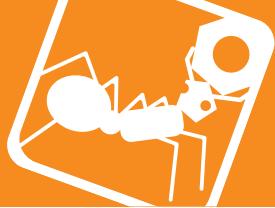

Tips

Standard nuts are right hand thread, single starts.

For use with steel or stainless steel lead

screws, L1320, L1321, L1322, and L1323.

Square Bronze Nut with Through for lead screws

Lead Screws &
Nuts

L1334

LEAD SCREWS & NUTS

Material

Bronze (CuSn7ZnPb).

Technical Notes

Suitable for movements with medium duty

loads.

Tips

Standard nuts are right hand thread, single starts.

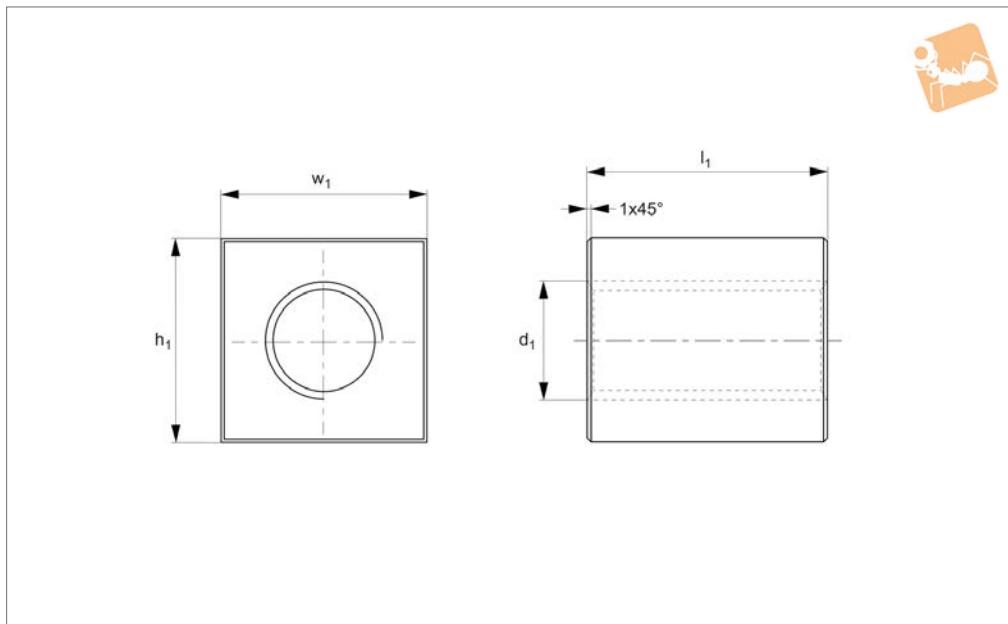

For use with steel or stainless steel lead screws, L1320, L1321, L1322, and L1323.

*Special M8 fixing screw with a reduced head diameter.

L1335

Material

Brass (EN 12164, CW614N-M).

Tips

Standard nuts are right hand thread.

For use with steel or stainless steel lead screws, L1320, L1321, L1322, and L1323.

Technical Notes

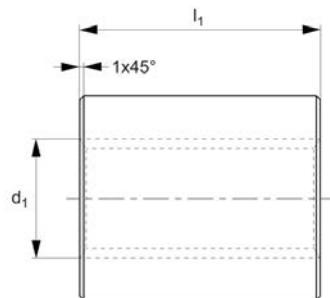

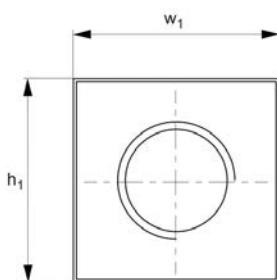

Used for fairly light loads.

Square Steel Nuts

for lead screws

Lead Screws & Nuts

L1336

LEAD SCREWS & NUTS

Material

Steel (11SMnPb37). Manufactured to ISO 2901/2903 (DIN 103).

Technical Notes

Used for low rotation speeds, manual

control, for clamping or locking functions and for receiving dead weights.

The use of steel to steel contact surface is not suitable for motorised motion.

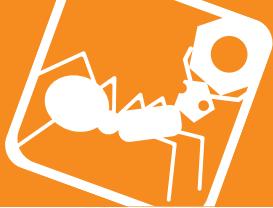

Tips

Standard nuts are right hand thread, single starts.

For use with steel or stainless steel lead screws, L1320, L1321, L1322, and L1323.

Square Steel Nut with Holes

for lead screws

Lead Screws &
Nuts

L1337

LEAD SCREWS & NUTS

Material

Steel (EN 10277-3, 11SMnPb37).

Technical Notes

Used as a fixing nut or for manual movements where the load is not important, as the steel to steel coupling used for moving

under heavy loads tends to seize.

The use of steel/steel contact surface is not suitable for motorised motion.

screws, L1320 and L1322.

*Special M8 fixing screw with a reduced head diameter.

Tips

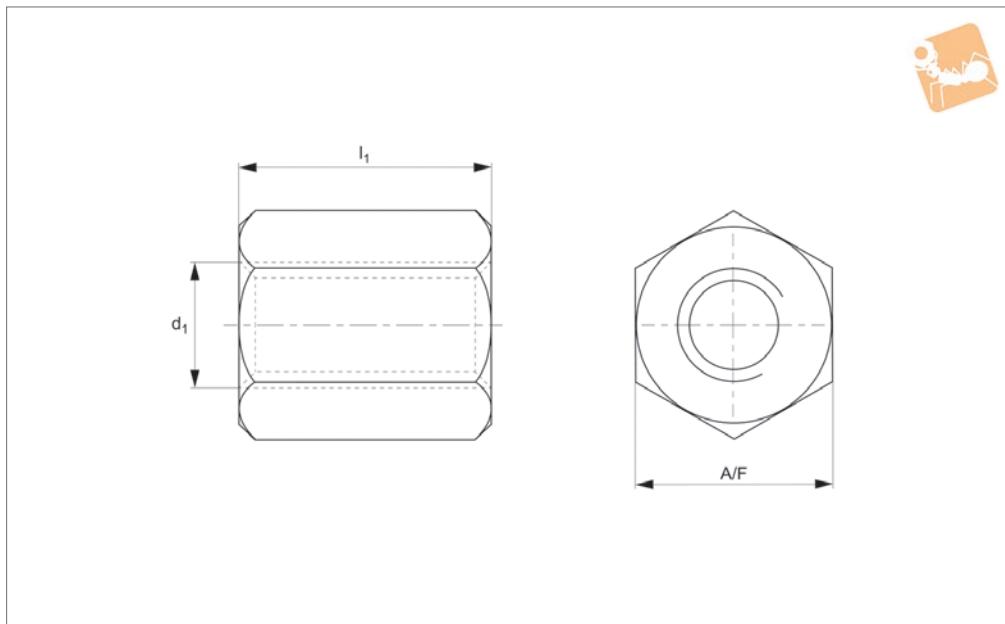

Standard nuts are right hand thread.

For use with steel or stainless steel lead

L1340

Material

Steel (EN10277-3, 11SMnPb37). Manufactured to ISO2901/2903 (DIN 103).

Technical Notes

Used for low rotation speeds, manual

control, for clamping or locking functions and for receiving dead weights.

The use of steel to steel contact surface is not suitable for motorised motion.

Tips

Standard nuts are right hand thread, single starts.

For use with steel or stainless steel lead screws, L1320, L1321, L1322, and L1323.

Flanged Self-Lubricating Plastic Nut

for lead screws

Lead Screws &
Nuts

L1342

LEAD SCREWS & NUTS

Material

Plastic (PA6.6 & MoS2).

Technical Notes

This nut type is made of a very wear resis-

tant, self-lubricating plastic.

The extra length of these lead screw nuts (three x nominal thread Ø) greatly reduces wear.

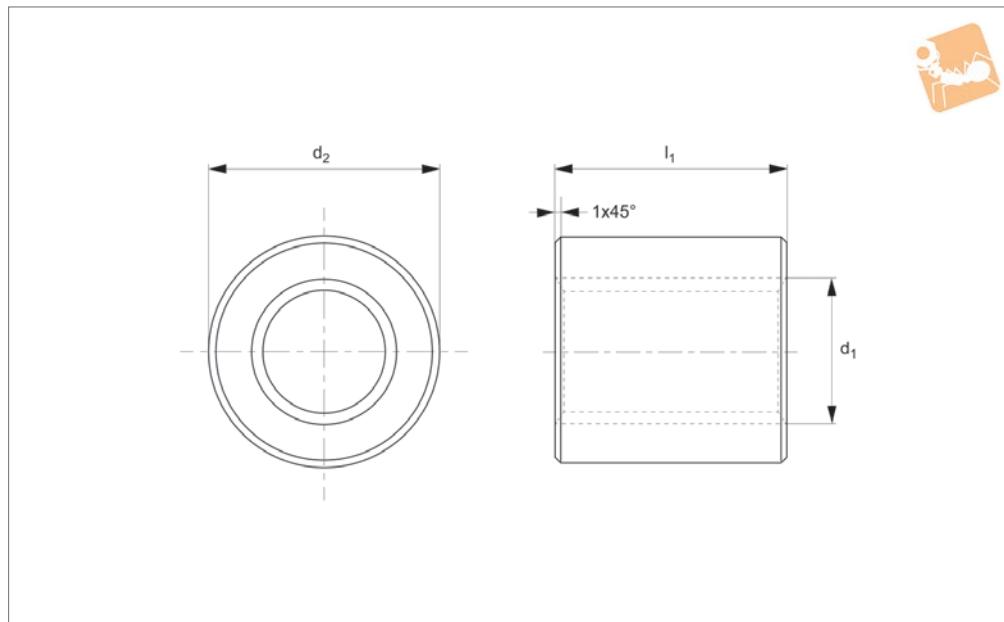

Tips

Standard nuts are right hand thread.
For use with steel or stainless steel lead screws, L1320, L1321, L1322, and L1323.

Lead Screws

General sizing data

Lead Screws

To select the correct size of lead screw and nut to use, please take into consideration the following three points:

1. The size required to minimise the wear of the nut due to friction.
2. The maximum load the screw can take before it bends.
3. The maximum rpm the screw can run at before it begins to vibrate.

Finding a size to minimise the wear of a nut

Due to friction between the lead screw and nut, some of the power put into the lead screw is lost as heat. The solution is to limit the contact surface area between the lead screw and nut as this will help reduce the amount of friction and wear on the nut.

Lead screws are used to convert rotary motion into linear motion.

The efficiency of a lead screw and nut is defined as the amount of power you get from the nut in relation to the amount of power you put into the lead screw to begin with.

For example, P_t (the power you put into the screw) divided by P_u (the power you get from the nut) = the efficiency.

The efficiency depends on the friction between the contact surfaces of the lead screw and nut, and the lead angle of the thread.

The speed the nut moves along the lead screw must also be taken into consideration in order to limit the amount of friction in the system.

Please see the formulae on the next page which help in calculating the speeds in your application.

Calculation of the Contact Surface Pressure p

The contact surface pressure p is calculated using the following formula.

$$p = \frac{F}{A_t}$$

F = Axial Force (N)

A_t = Contact Surface Area (mm^2)

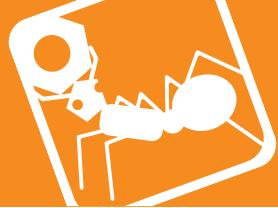

For standard nuts each A_t value has been listed in the product tables

Lead Screws from Automation Components

LEAD SCREWS & NUTS

Lead Screws

General sizing data

Calculating of the sliding speed Vst

The sliding speed is the result of the speed at which the nut moves and the friction.

Calculating the sliding speed helps you to calculate the required rpm of a screw if you know what speed the nut must move at, or help to calculate how fast the nut will move if you know the rpm of the screw.

You must first find the sliding speed of your lead screw and nut using one of the below formulae and then use this to calculate either rpm or output speed of the nut.

The sliding speed is calculated using one of the following formulae.

If the rpm of the screw has already been defined:

$$Vst = \frac{n \cdot P}{1000 \cdot \sin \alpha}$$

Vst = sliding speed on mean diameter (m/min)

n = rpm

P = thread pitch (mm)

α = thread helix angle

If you have already established at which speed the nut must move:

$$Vst = \frac{Vtr}{\sin \alpha}$$

Vst = sliding speed on mean diameter (m/min)

Vtr = motion speed (m/min)

α = thread helix angle

Please note that the rpm and the speed at which the nut moves are bounded as follows:

$$n (\text{rpm}) = \frac{1000 \cdot Vtr}{P}$$

n = rpm

Vtr = speed at which the nut moves (m/min)

P = thread pitch (mm)

The critical rpm is the speed at which screw vibration begins to appear. This rpm speed must never be reached because the vibrations cause serious operating issues. The critical rpm depends on lead screw diameter, how the ends of the lead screw are supported, the free length (l_g), and how accurately the lead screw is assembled.

For values shown in the following graphs assume a minimum safety factor for assembly accuracy as per the following chart.

Assembly accuracy coefficient

Assembly accuracy	Conditions	Safety coefficient
Good assembly accuracy: Nut alignment to screw within 0,05mm	Assembly to which the bearing mounts are assembled CNC machined very accurately.	1,3 – 1,6
Average assembly accuracy: Nut alignment to screw within 0,10mm	Bearing mounts installed onto assembly that has not been CNC machined, alignments accurately checked after mounting.	1,7 – 2,5
Low assembly accuracy: Nut alignment to screw within 0,25mm	Bearing mounts installed onto assembly that has not been CNC machined and alignment is not checked accurately.	2,6 – 4,5

Example

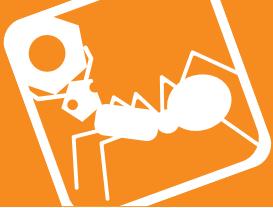

To find the critical rpm of a lead screw 40 mm diameter with 7 mm lead, 3 metres long with end support configuration double bearing one end, single bearing the other end (see graph 3) with average assembly accuracy.

Critical rpm graph 3 gives the critical rotation speed of 1000 rpm.

From the assembly accuracy coefficient chart we take the maximum value for the safety coefficient = 2,5

We can calculate the acceptable working speed at a maximum rpm of

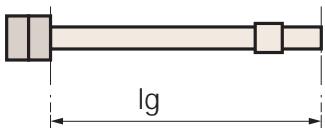

$$N_{\max} = 1000 / 2,5 = 400 \text{ rpm}$$

Efficiency

The numerical efficiency values of each limit are shown in the table 'Trapezoidal Lead Screw and Nut Specifications'.

The larger the lead angle of a lead screw, the greater the efficiency is for the lead screw. It is therefore recommended, where possible, to use a lead screw with a lead angle as high as possible.

The lead angle for each size of screw can also be found in the trapezoidal lead screw and nut specifications table. To help reduce friction as far as possible, we make precision rolled trapezoidal lead screws with minimal roughness on the side of the threads, always less than $1\mu \text{ Ra}$ (usually 0.2 to 0.7μ).

For applications where low friction is important, we also make wear resistant self lubricating flanged plastic nuts. The friction factor of these is 0.1 with the initial breakaway friction factor being 0.15.

$$\eta = \frac{1 - f \cdot \tan \alpha}{1 + \frac{f}{\tan \alpha}}$$

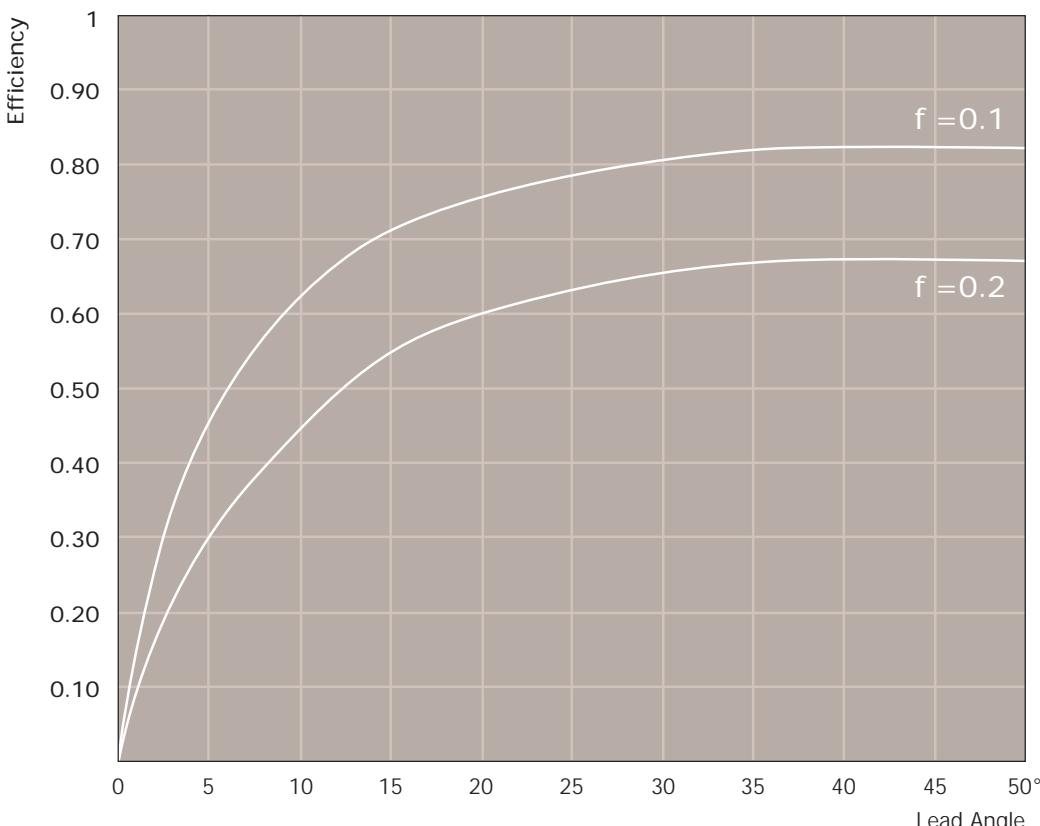

η = efficiency

f = dynamic friction factor between screw and nut materials

α = lead angle of threads

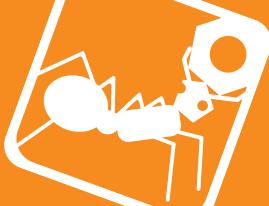

The numerical efficiency values of each limit are shown in the 'Trapezoidal Lead Screw and Nut Specifications' table.

 \end{aligned}$$

Reversibility/backdrive

No backdrive where lead angle $< 2^\circ 30'$.

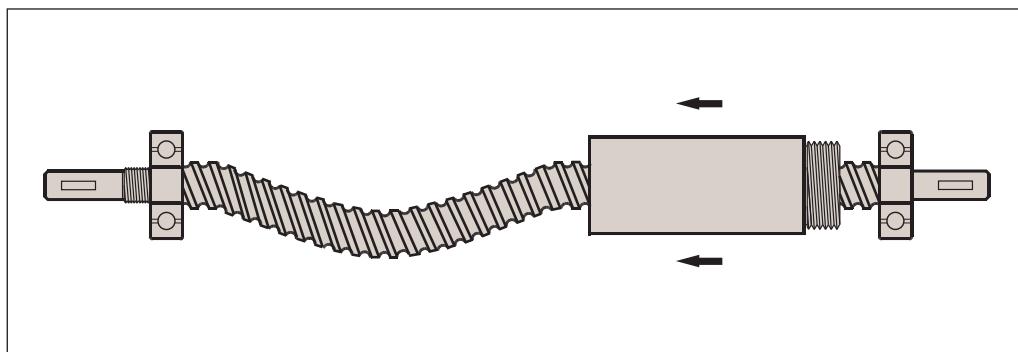

At angles up to $5-6^\circ$ there is a low potential of system backdrive.

Backdrive is important in vertical applications.

Maximum compression load

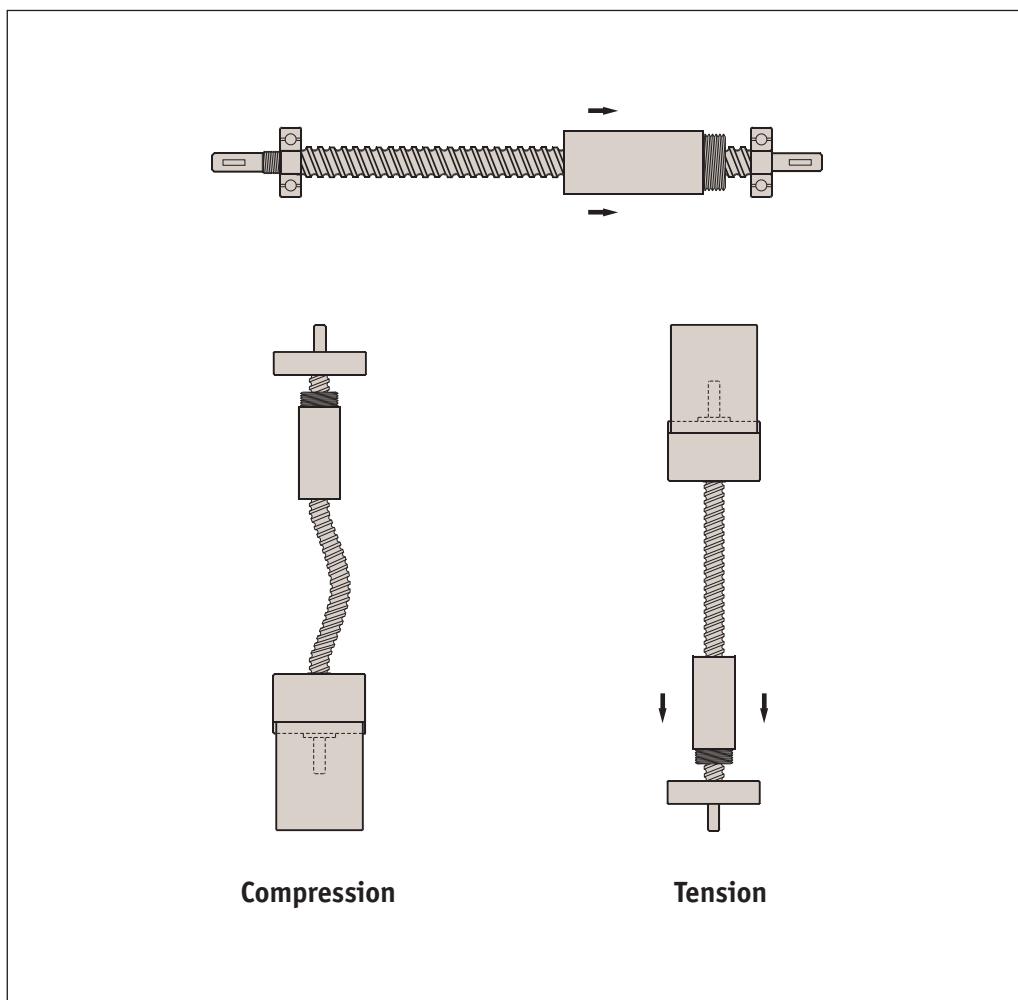

The load acting upon a nut that would tend to compress or buckle the screw. Also referred to as column loading, this rating is effected by the load, support type, screw diameter, and length between the load point and support housing.

Normally, a screw also experiences a tension load (a force which attempts to stretch the screw). For vertical applications, it is better to configure the screw assembly so that the screw is in tension, and not in compression. To find maximum compression load a screw can take, please refer to critical axial load technical pages.

Tension loading

The load acting upon a nut that would tend to stretch the screw. The maximum tension load of a screw assembly is the load rating of the nut. For vertical applications, it is better to configure the ball screw assembly so that the screw is in tension and not in compression.

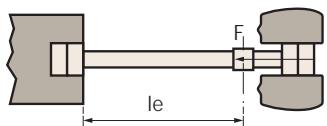

Lead Screws

Critical axial load - Peak load

When choosing a lead screw you need to consider the critical axial load to avoid the screw bending under excessive loads. This is the buckling load. This is important where the end screws are being used in compression. The critical axial load depends on the core diameter of the lead screw (d_{g}), how the lead screw is supported at each end, and the free length of screw (l_e). In the graphs below, please allow a minimum safety factor of > 2.

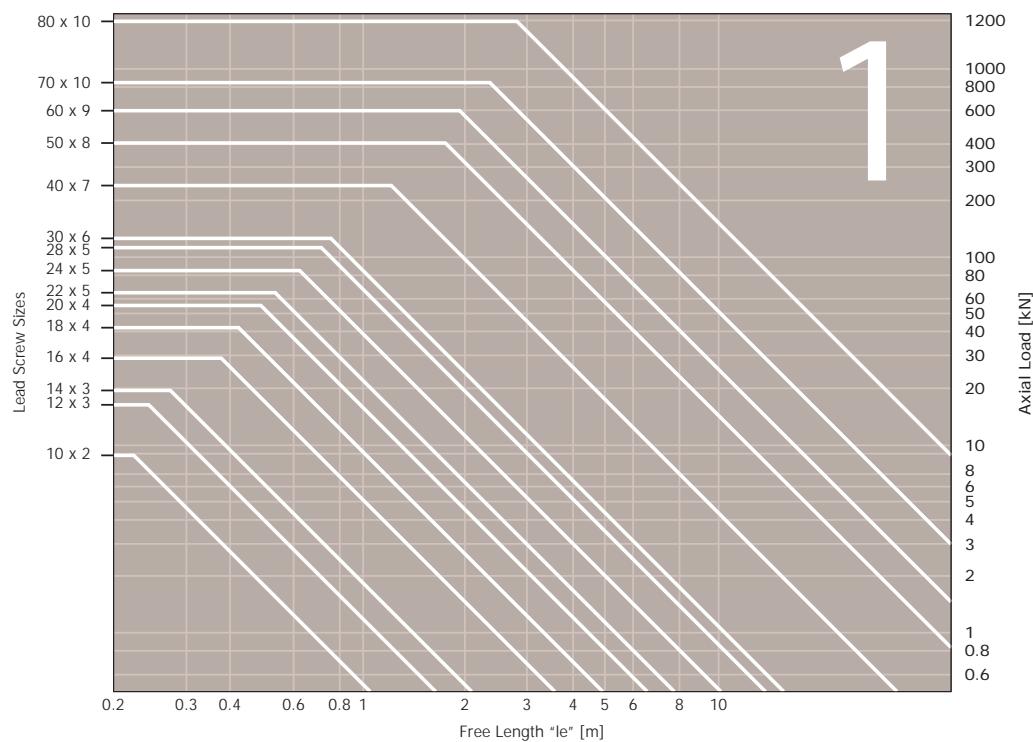

Supported each end by double bearings

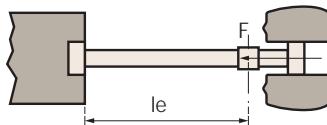

Example

Find the allowable axial load of a 30x6 screw 3000mm long with constraint conditions as in drawing 1. From the accompanying graph take $F_{\text{max}}=11\text{kN}$ with safety factor of 2 and assume $F_{\text{allow}}=11/2=5,5\text{kN}$.

LEAD SCREWS & NUTS

Critical axial load- Double bearing one end

**Supported one end only by
double bearing**

**Torque**

The torque necessary to move a screw and nut system is calculated from the following equation.

$$C = \frac{F \cdot P}{2\pi \cdot n \cdot 1000}$$

C = torque (input) (Nm)

F = axial force on nut (N)

P = true lead of screw (mm)

η = efficiency (assume efficiency with first breakaway friction factor f = 0.2)

Example

Find the torque required to move a 30x6 lead screw and nut

Resistant axial force = 10.000 N $\eta = 0.26$

Screw lead = 6 mm

$$\text{Torque} = \frac{F \cdot P}{2\pi \cdot n \cdot 1000} = \frac{10.000 \text{ (N)} \cdot 6 \text{ (mm)}}{2 \cdot \pi \cdot 0.26 \cdot 1000} = 36.7 \text{ Nm}$$

The torque value however does not consider the efficiency of mechanical parts moving together with the screw system, such as bearings, belts or other transmission components.

In a planning project phase, an increase between the 20% and 30% of the theoretical value is recommended. If electric motors with low static torque are used assume another increase of 50% to find nominal torque.

$$C = 36.7 \text{ (Nm)} \cdot 1.3 \cdot 1.5 = 71.6 \text{ Nm}$$

Power

The power necessary to move a trapezoidal screw and nut system is calculated from the following equation.

$$P = \frac{C \cdot n}{9550}$$

9550 is a constant P = power (kW) C = torque (Nm) n = rpm

Example of calculation

Calculate the power necessary to move the screw 30 x 6 in the above example at 600 rpm

$$C = \frac{C \cdot n}{9550} = \frac{71.6 \text{ (Nm)} \cdot 600 \text{ (rpm)}}{9550} = 4.5 \text{ kW}$$

This is the minimum power necessary to move the system

General considerations for bronze nuts

In all three situations described, the wear of the nut is affected by the lubrication used during operation and as such, giving accurate figures for the life expectancy of the nut is impossible.

Extra care must be taken when the temperature of the application is above +140°/150°C, as such temperatures can damage lubricants and as a consequence, cause the nut to wear quicker. In these situations we recommend the use of lubricants designed for high temperatures.

Safety factor for the forces of inertia f_i

During the selection process we must also check that the inertia forces present during acceleration and deceleration are relatively low so that the value of $p \bullet Vst$ remains within the controlled limits. Whereas this calculation is difficult, in the presence of a non-uniform movement or under great variations, safety factors reported in the chart below must be considered.

Safety factors with respect to the forces of inertia

Load type	f_i
Loads with constant acc. / dec. controlled	from 1,00 to 0,50
Loads with constant start and stop at tear	from 0,50 to 0,33
Loads and speed greatly variable	from 0,33 to 0,25
Loads in presence of shocks and vibrations	from 0,25 to 0,17

The coefficient f_i is used to correct the value of $(p \bullet Vst)_{max}$ derived from the 'Sliding Condition for Bronze' graph, considering the maximum allowable sliding speed in relation to the contact surface in working conditions. Working area limits (A, B or C) must be taken into consideration.

To calculate the admissible $p \bullet Vst$ of the nut in working conditions the following must be used

$$p \bullet Vst \text{ am} = (p \bullet Vst)_{max} \bullet f_i$$

Example of calculation with bronze nut

Selecting a bronze nut which must operate continuously and remain within the maximum limit value of $p \bullet Vst = 21$ (Area A), with good lubrication. Constant axial load without relevant variations, with forces of inertia limited by controlled acceleration/deceleration.

Axial Load	F	=	1200N (1Kg $f=9,81N$)
Constant motion speed	Vtr	=	2,8m/min

Evaluation of $p \bullet Vst$ using nut L1331.R30-06
(bronze flanged nut with thread Tr 30x6 1 start, right)

$$P = \frac{F}{At} = \frac{1200 \text{ (N)}}{1370 \text{ (mm}^2\text{)}} = 0,87 \text{ N/mm}^2$$

F = Axial Force (N)

At = Contact Surface Area (mm^2).

For standard nuts each At value is listed in the product tables.

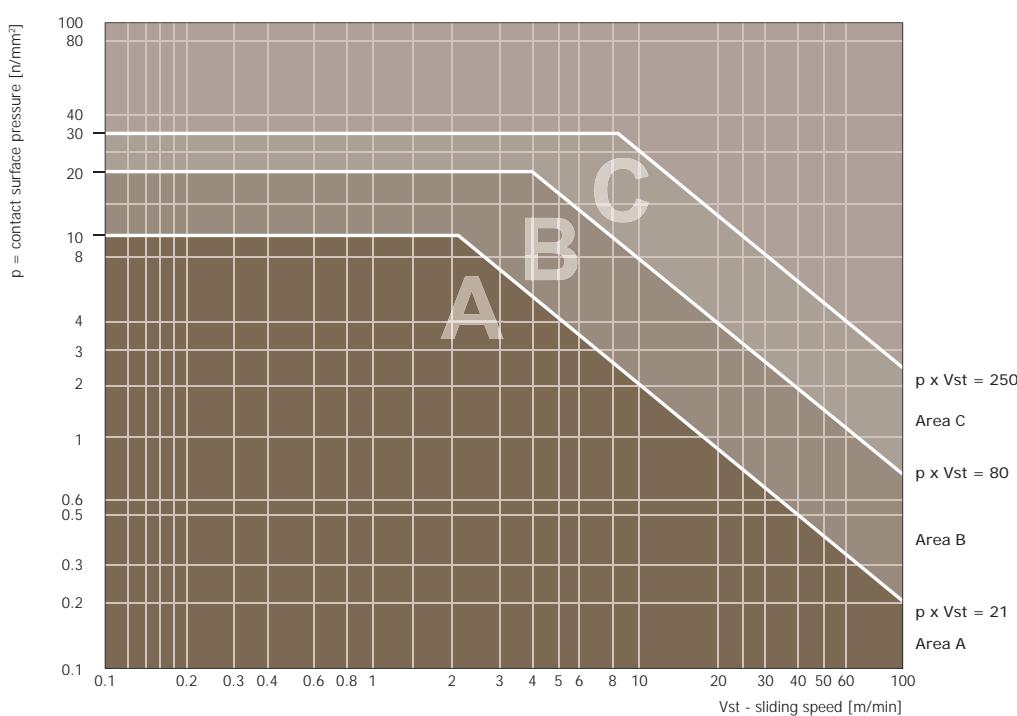

Lead Screws from Automation Components

Choosing a nut size

Bronze nut sizing

When using a bronze nut, calculate the sliding speed and use the graph below to see if it is suitable. The graph has three areas each characterised by certain working conditions. These figures are evaluations obtained from the results of experiments we have carried out. Good lubrication is always required, if little or no lubrication is used the working conditions may vary greatly.

Sliding condition for bronze.**Area A** Area A is enclosed by the limit $p \cdot Vst = 21 (\text{N/mm}^2 \cdot \text{m/min})$

These are the best operating conditions.

Continuous operation is possible as the amount of friction produced within these limits $p \cdot Vst$ is pretty low. Therefore the life of the nut is very good.

Area B Area B is enclosed by the limit $p \cdot Vst = 80 (\text{N/mm}^2 \cdot \text{m/min})$

These operating conditions are more severe. Constant lubrication is required to help prevent wear of the nut and improve its lifetime.

Continuous operation is possible for limited periods only as the amount of friction produces overheating of the nut. Although lubrication helps reduce heat, the life of the nut is limited.

Area C Area C is enclosed by the limit $p \cdot Vst = 250 (\text{N/mm}^2 \cdot \text{m/min})$

In this area, the operating conditions are very severe.

Continuous operation is not possible.

Even with good lubrication the amount of friction and heat produced causes rapid wear of the nut.

Example of calculation with bronze nut

The sliding speed is calculated using formulae:

$$Vst = \frac{Vtr}{\sin \alpha} = \frac{2.8 \text{ m/min}}{\sin 4^\circ 03'}$$

$$Vst \approx 39,84 \text{ m/min}$$

Vtr = motion speed (m/mm) α = thread helix angle

The value $p \cdot Vst$ is:

$$p \cdot Vst = 0,87 \text{ N/mm}^2 \cdot 39,84 \text{ m/min} \approx 34,66 \text{ N/mm}^2 \cdot \text{m/min}$$

In order to remain within the continuous working conditions, corrected by the safety factor f_i from the table, in this case =0,77, the maximum allowable value of $p \cdot Vst$ is:

$$p \cdot Vst_{am} = (p \cdot Vst)_{max} \cdot f_i = 21 \cdot 0,77 \text{ N/mm}^2 \cdot \text{m/min}$$

$$p \cdot Vst_{am} = 16,15 \text{ N/mm}^2 \cdot \text{m/min}$$

As the maximum allowable value of $p \cdot Vst$ is lower than the value obtained with a nut L1331.R30-06, we shall try using a nut L1335.R36-06 (square bronze nut with 36x6 thread)

The contact surface pressure is:

$$p = \frac{F}{At} = \frac{1200 \text{ (N)}}{3630 \text{ (mm}^2\text{)}} = 0,33 \text{ N/mm}^2$$

F = Axial Force (N)

At = Contact Surface Area (mm^2)

The sliding speed remains the same as the previous calculation

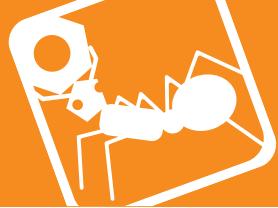

$$Vst = 39,84 \text{ N/mm}^2$$

The value of $p \cdot Vst$ is now:

$$p \cdot Vst = 0,33 \text{ N/mm}^2 \cdot 39,84 \text{ m/min} \approx 13,15 \text{ N/mm}^2 \cdot \text{m/min}$$

The value obtained is now lower than the allowable one, therefore the L1335.R36-06 will be suitable.

Lead Screws from Automation Components

Plastic nuts selection

In applications where low noise is important or where lubrication is not allowed (grease or oil), self lubricating plastic nuts are recommended. The use of plastics is very constrained by the actual working conditions, we suggest discussing the application with our technical department and not relying on a choice based only on intuition. This is because plastic materials have good features such as low friction and self-lubrication, but at the same time limitations caused by operating temperatures, hygroscopic problems, or certain mechanical features that may not be suitable for the intended use. An advanced study of the application in this case is therefore required in order to obtain optimum performance.

Regarding the plastic nuts, the study of the product $p \cdot V_{st}$ allows you to draw a chart which shows a curve that limits the values of $p \cdot V_{st}$ within which we have a gentle flow of the surfaces in contact with limited wearing of the nut and constant in time. Operating outside the limit drawn on the chart is not possible as in this case as the nut would wear quickly.

Cylindrical Nut L1343

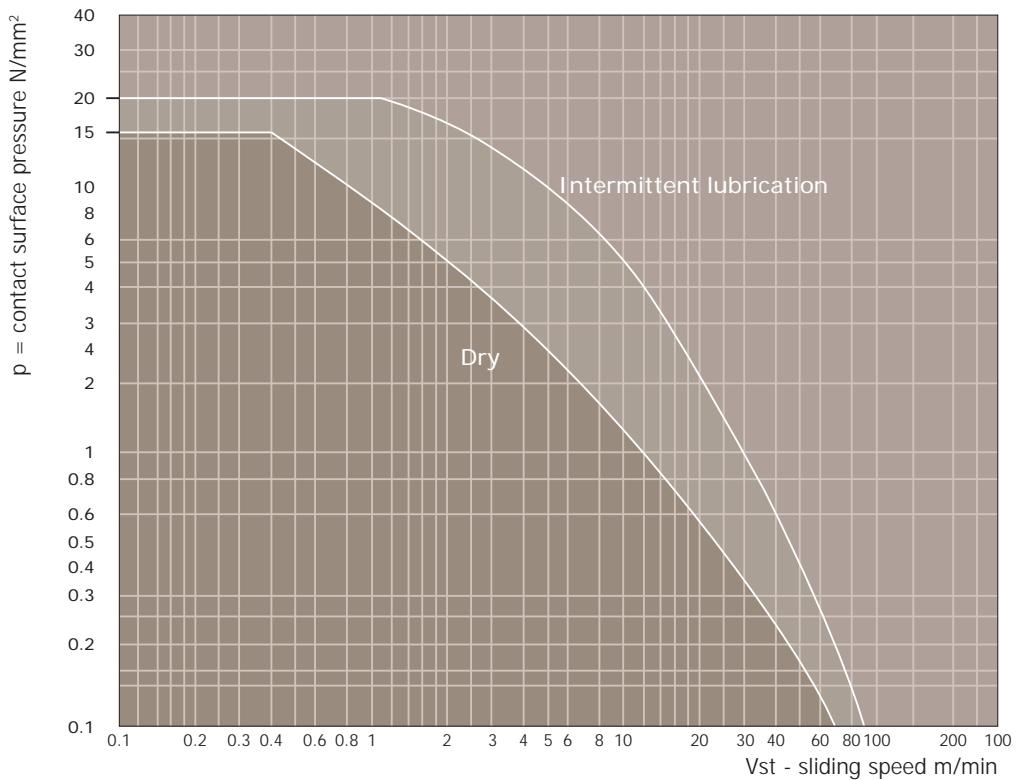

The graph below shows the limit of $p \cdot V_{st}$ of the cylindrical nut L1343. As this plastic is resistant to wear but not self-lubricating, the following limits have been shown when the nut is dry, and when it is lubricated intermittently.

Sliding condition for nuts L1343

Test conditions:

- Continuous operation.
- Temperature 23°C.
- Relative humidity approx 50%.

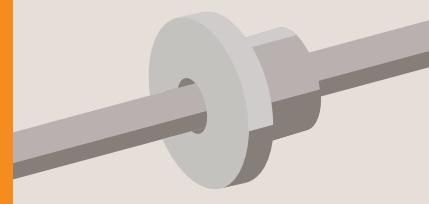

Recommended Speeds

Lead Screws

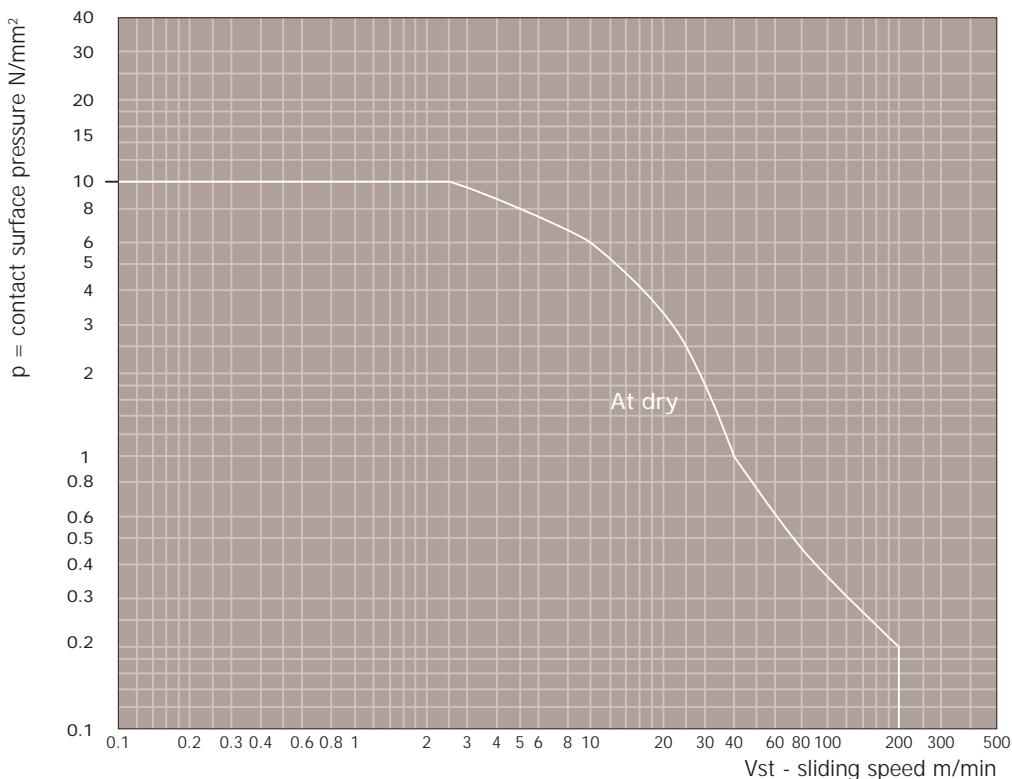

Self-lubricating plastic flanged nut L1342

Lead Screws from Automation Components

The graph below shows the limit of $p \bullet V_{st}$ of nut L1342. The plastic used for the L1342 features a strong resistance to wear and complete self-lubricating properties.

Prior to using the L1342, please read the previous pages.

Sliding conditions for self-lubricating plastic nuts L1342

Test conditions:

- Continuous operation.
- Temperature 23°C.
- Relative humidity approx 50% with no lubrication.

Compact rail

Advantages

Easy to install. Allows for some misalignment at installation. Compact system, small footprint compared to other rail systems. Preload adjustable by hand.

Disadvantages

Although it can take very large loads it cannot take anywhere near as much load as the linear guideways rail system.

X Rail

Advantages

Cheaper alternative to the compact rail. Use of T and U rails allows for misalignment at installation.

Preload adjustable by hand.

Available in AISI 316L stainless steel suitable for use in applications requiring a high level of corrosion resistance, including sea water.

Disadvantages

Cannot take as much load as other systems. Not suitable for moment loads.

Linear guideways

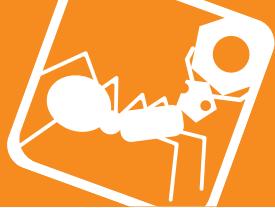

Advantages

Can take extremely high loads including moment loads. Very smooth in operation.

Disadvantages

Must be aligned very accurately which costs time and money preparing the mounting surface properly.

Technical Information

Lead screws supporting rail systems

Lead Screws

Shafts + bearings

Advantages

Available in a range of materials and sizes. A length of shaft bar is typically cheaper than the cost of an equivalent size precision linear rail.

Disadvantages

A larger diameter shaft would be required when there are long lengths and high loads involved compared with the size of an equivalent shaft support rail you would need. This is because they would only be supported at the ends and the shaft ends could bend in the middle if the diameter was too small.

LEAD SCREWS & NUTS

Shaft support rail

Advantages

Shaft support rail systems have a shaft support along the full length so are less likely to flex.

Disadvantages

Similar to linear guideways, must be aligned very accurately otherwise any mis-alignment may cause the system to 'snatch'.

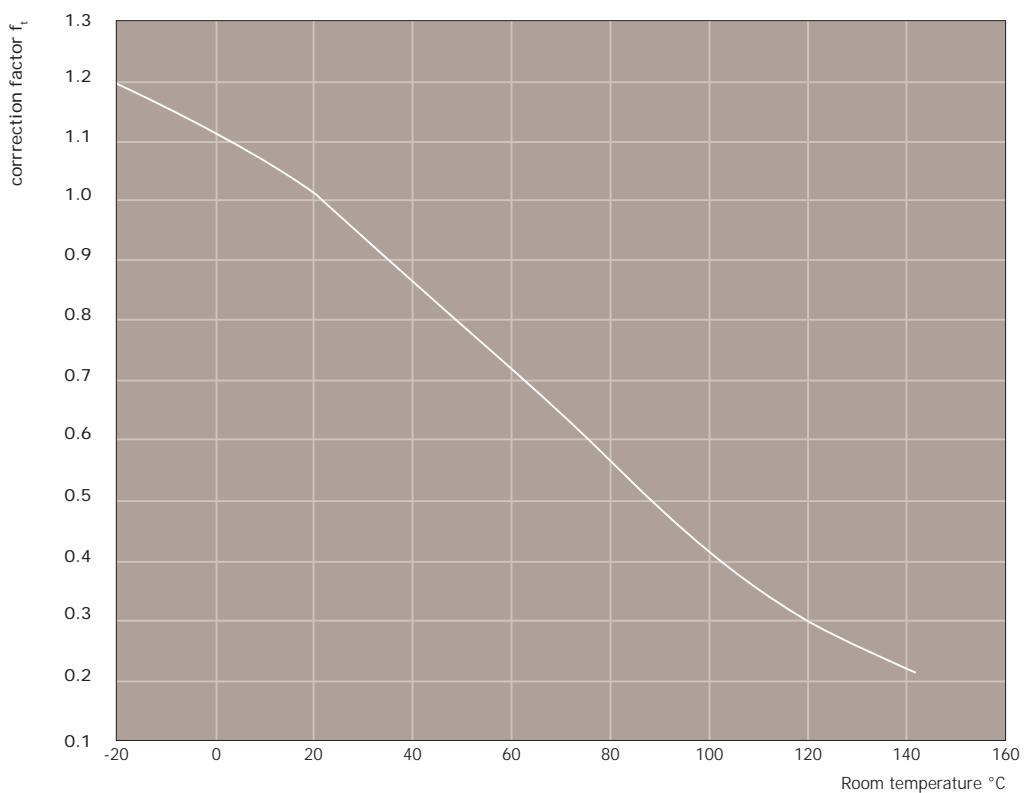

**Safety factor or the forces of inertia f_i**

During the selection process check that the inertia forces present during acceleration and deceleration are relatively low so that the value of $p \cdot V_{st}$ remains within the required controlled limits. Whereas this calculation is difficult, in the presence of a non-uniform movement or under great variations a safety factor in the chart below must be applied.

Load type	f_i
Loads with constant ramps of acc. / dec. controlled	from 1,00 to 0,50
Loads with constant start and stops	from 0,50 to 0,33
Loads and speed greatly variable	from 0,33 to 0,25
Loads in presence of shocks and vibrations	from 0,25 to 0,17

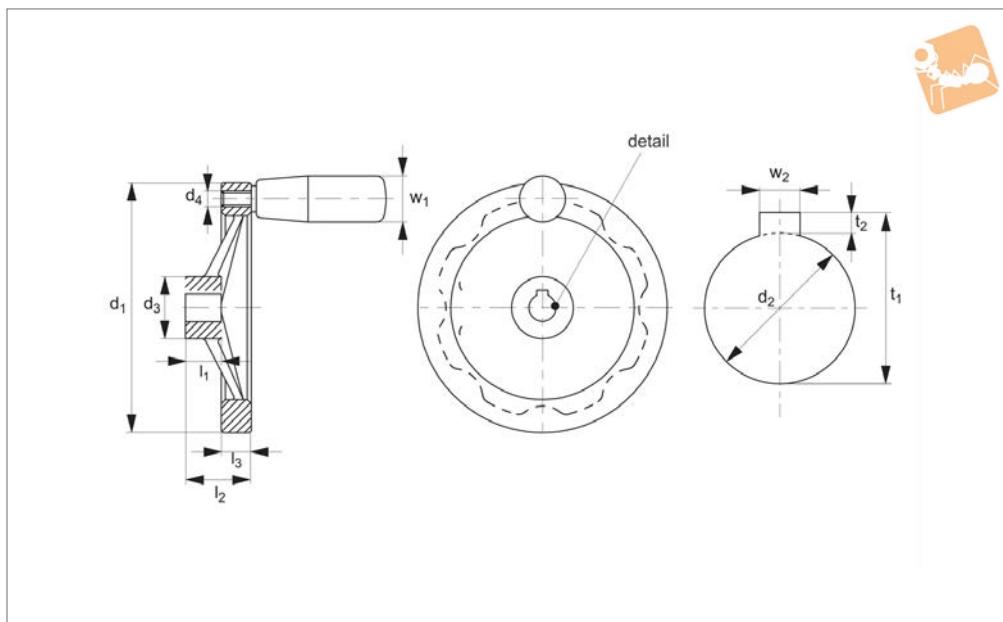

Correction factor for working environment temperature

Using plastic nuts L1343 or L1342, the value of $p \cdot V_{st}$ must be corrected in relation to the working temperature. Plastic becomes softer at higher temperature and can handle less load. At lower temperatures, it becomes harder and takes heavier loads. Correction factor f_t is shown in the graph below.

Disc Type Handwheels

Lead Screws & Nuts

L1458

LEAD SCREWS & NUTS

Material

Aluminium mould casting. Handle duroplast DF 31 black.
Hub machined; rim turned and mirror-finished on all sides, non-machined surfaces cleanly blasted.
For corresponding handle details see no. rotating handle.

Technical Notes

There are gripping indentations on the rear sides.
The non-machined, raw surfaces are blasted; together with the mirror-polished rim these handwheels are therefore showing a finish which in most cases does not require additional lacquering.

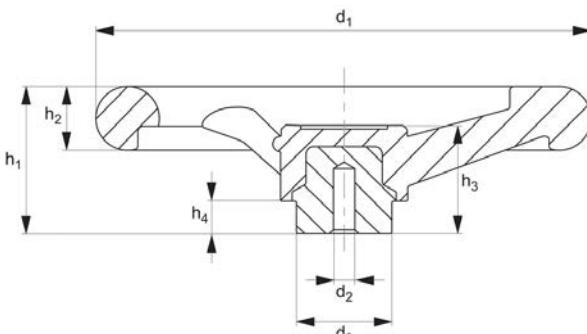

Temperature range up to 110°C. Also available in black plastic coated - on request.

For keyways information (dim. t_1 and b_3) to DIN 6885.

L1459

**Material**

Standard: Duroplast, black. Zinc plated steel hub.

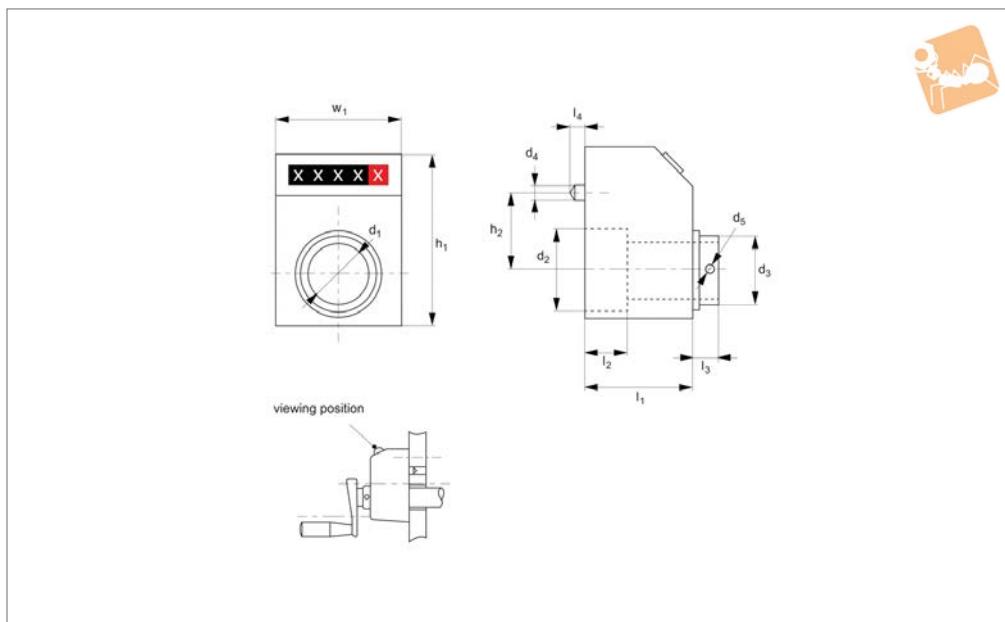

Reinforced: Duroplast with glass fibre

beads of increased strength, black zinc plated steel hub.

Technical Notes

The pilot hole allows various sizes of holes, keyways etc. to be machined into the boss.

Technical Information

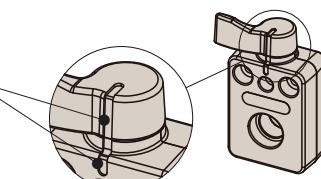

One-touch spindle locks

Lead Screw Accessories

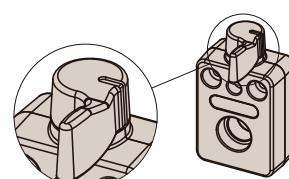

Features

- One-touch spindle locks enable quick and secure locking of shafts with one click of the knob.
- When the one-touch spindle lock is operated, the knob clicks and the shaft is locked with a steady force. This provides reliable locking of shafts.
- The knob position and the indication line clearly indicate lock/unlock position.

The indication line aligns when one-touch spindle lock is locked

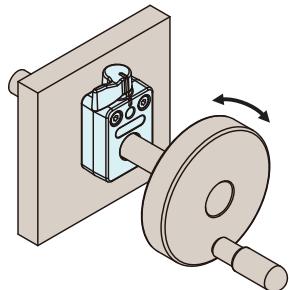

(locked)

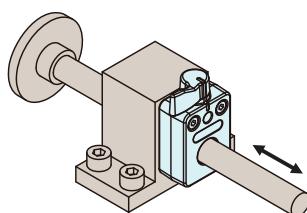

(unlocked)

How to use

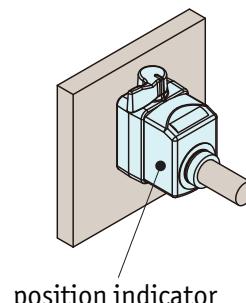

For locking of spindles

For locking of sliding shafts

Can be used with position indicators

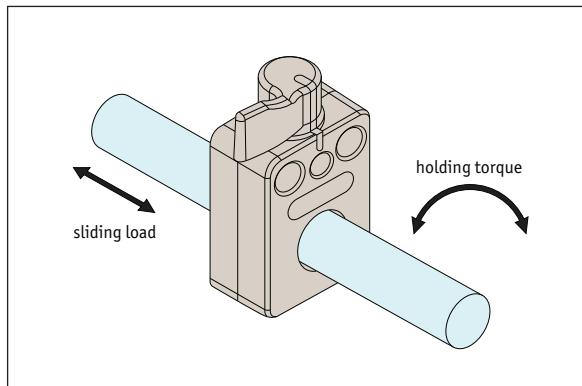

position indicator

Technical Information

One-touch spindle locks can fix both revolving and sliding of shafts.

L1480

Material

Housing: Polyamide (glass-fibre reinforced)

Boss: Polyamide (glass-fibre reinforced)

Base: Polyamide (glass-fibre reinforced)

Insert: Stainless steel

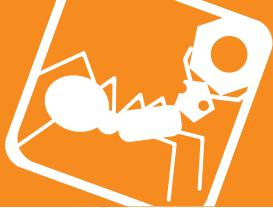

Technical Notes

It has teeth inside and it engages at every 7.2° (=360° / 50).

pulls the spindle by the inner spring with 70N force to prevent chattering of the spindle. Note: The spindle should be fully inserted into the knob for 25mm.

Precision Miniature Lead Screws

Overview

Precision
Lead Screws

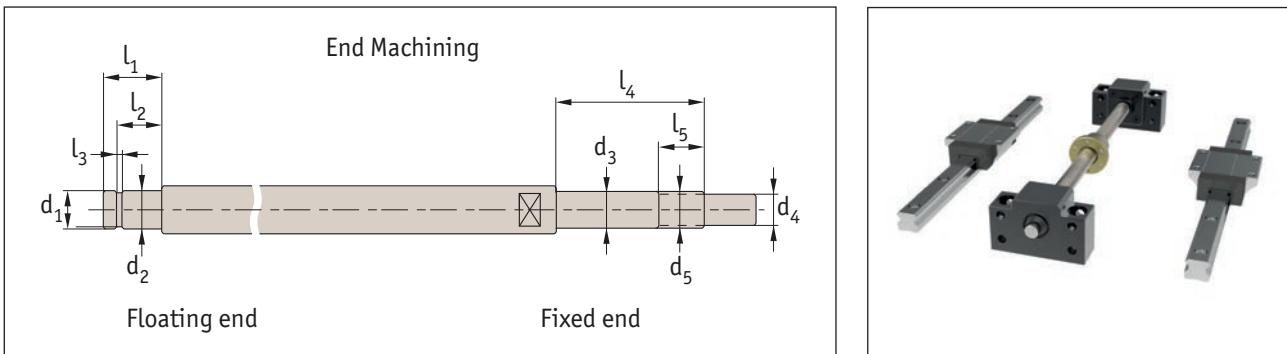

- Select the relevant size lead screw diameter and load required.

- These are precision, high helix lead screws from stainless steel (304 grade)
- We can cut length to suit and/or machine the ends to your requirements
- They have an accumulative lead error of $\pm 0.20/300\text{mm}$ (C10 grade)
- The actual clearance depends on the nut selected L1350 standard flanged nut or L1351 anti-backlash nut
- Nuts are very smooth running with little friction. They are made from plastic resin (PPS).
- The anti-backlash nuts are longer than the standard length nuts as they incorporate a spring pushing the two halves of the unit apart.

Minature Flanged Floating Support

for miniature lead screws

Lead Screws &
Nuts

L1356

LEAD SCREWS & NUTS

Technical Notes

Generally used with small diameter lead screws - see technical pages for lead screw core diameters and end machining

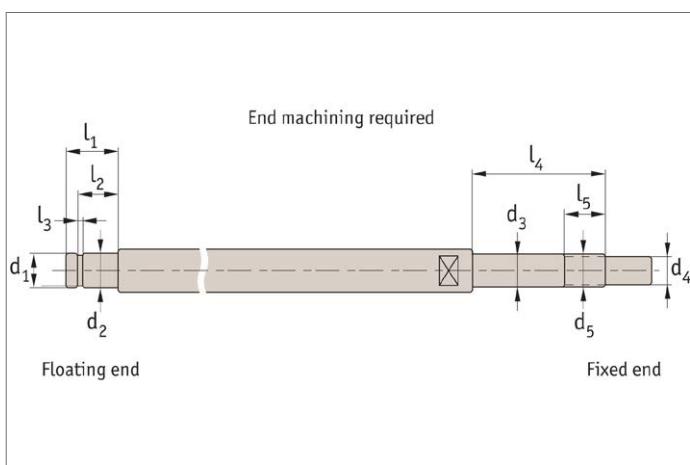

required.

Use with fixed support unit (L1354). For required end machining of the lead screws see technical pages.

Tips

End machining of lead screws on request.

Order No.	d ₁	d ₂ -0.007 -0.020	d ₃	d ₄	d ₅	d ₆	d ₇	l ₁	t ₁	t ₂	w ₁

Precision lead screws

The high lead thread form maximises linear motion and minimises shaft rotation. The close tolerance, free running nuts are individually matched to their lead screws and are ideal for miniature applications requiring rotary to linear, or linear to rotary actuation.

Anti-backlash nuts

For applications requiring precision positioning there is now a newly patented Anti-backlash nut. This device, consisting of only three components, utilises the constant force of a compression spring to push two halves apart. This action eliminates any play (backlash) which exists between the internal thread of the nut and the external screw thread.

To ensure accuracy and repeatability the nut can be fine tuned through the use of many available spring constants, to meet any preload design requirements.

Lead screw specification	High precision lead screw
Lead error	±0,2mm/300mm
Repeatability	0,01mm
Straightness	0,03mm/100mm
Backlash	0,08mm (zero when using anti-backlash nut)
Temperature range	-30°C to +90°C

Design considerations

Critical speed

The critical speed of a lead screw is the maximum speed (rpm) before the screw will become dynamically unstable. This results when the forced frequency of the rotating screw corresponds to its natural frequency. Its value is dependent on the length of the screw, the diameter of the thread, and the support configuration. The critical speed value is governed by the following equation.

$$\text{Critical screw speed (RPM)} = K \times C \times 10^6 \times (d/L^2)$$

Where;

K = End support factor

0,36 one end fixed, other free

1,00 simple supports both ends

1,47 one end fixed, one simple

2,23 both ends fixed

C = Material factor

4,5 for Stainless Steel screws

1,6 for Aluminium screws

d = Root diameter of the screws

L = Length between bearing supports

Load

In order to properly incorporate a lead screw into a design, load requirements must be taken into account. These numbers are based on the shear of the nuts and does not take shaft buckling into account. Wherever possible, nuts should be positioned so as to be put in tension, pulling the load. This eliminates the need for buckling considerations.

Listed below are some helpful formulae to assist in proper lead screw selection.

$$\text{Critical load (N)} = K \times C \times 10^6 \times (d^4/D^2)$$

Where;

K = End support factor

0,25 one end fixed, other free
(figure 1)

1,00 simple supports both ends
(figure 2)

2,00 one end fixed, one simple
(figure 3)

4,00 both ends fixed (figure 4)

C = Material factor

13,4 for Stainless Steel screws

4,8 for Aluminium screws

d = Root diameter of the screws

D = Length between bearing supports

$$\text{Torque to move a load (T)} = F \times L/2 \times \pi \times E$$

Where;

F = Load

L = Lead

E = Efficiency (see product pages)

End fixing configurations

Precision Lead Screws from Automation Components

L1349

Material

Stainless steel screw (SUS 304).

Technical Notes

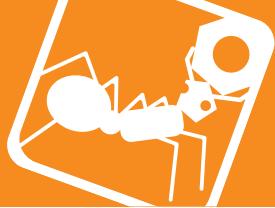

High precision.

The 'lead' refers to the distance the nut will travel for one complete revolution of the thread.

Order corresponding lead screw- see part

L1350.

L1351

Material

Stainless steel screw (SUS 304),
resin nut (PPS).

Technical Notes

High precision. No backlash.

The 'lead' refers to the distance the nut will travel for one complete revolution of the thread.

Nut fitted to screw, to ensure anti-backlash
- unlike L1349 and L1350 which can be

ordered separately.

L1370

Material

Steel (16MnCr5 or 100Cr6), with Vulkollan seals.

Technical Notes

To DIN 69051 form B.

Axial play for 5mm pitch = 0,05mm; for 10mm pitch = 0,10mm; for multi-starts = 0,20mm.

Preload max. 5% of max. dynamic load.

For axial run-out, concentricity and parallelism figures see technical pages.

With lubrication and fixing holes.

For use with ball screws no. L1375.

Tips

For easy mounting of the ball screw nuts see the nut bracket - part L1377.

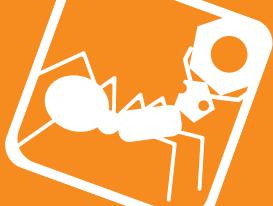

For miniature ball screws Ø6 to Ø14 see part no. L1379.

Important Notes

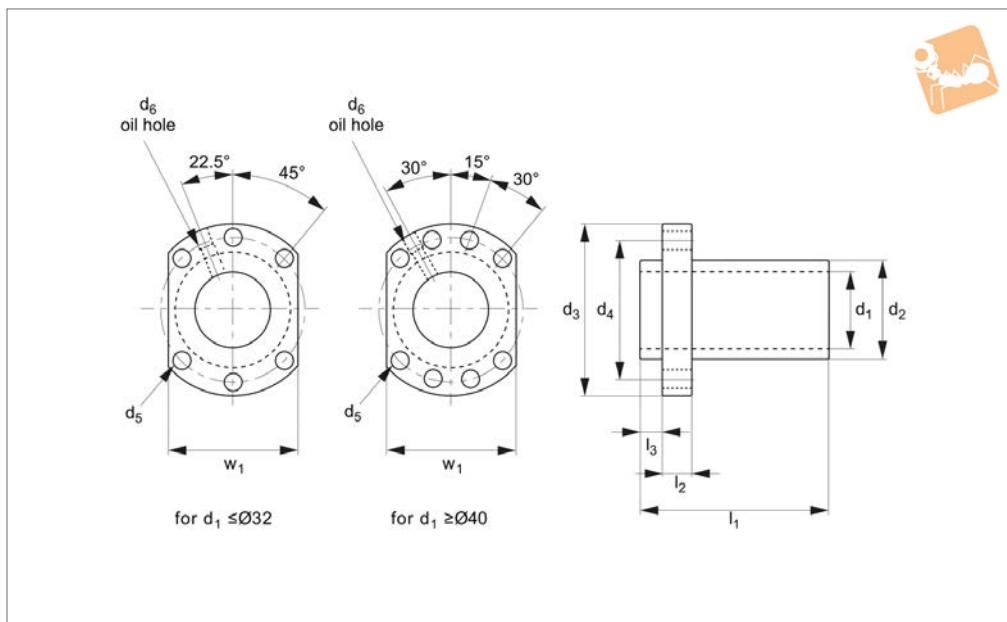

Fit ball nut to screw using the sleeve provided. Offer up the ball nut to the screw and slide carefully on. Do not remove the ball nut from the sleeve provided - the ball bearings can come loose rendering the ball nut unusable.

L1371

Material

Steel (16MnCr5 or 100Cr6), with Vulkolan seals.

Technical Notes

Axial play for 5mm pitch = 0,05mm; for 10mm pitch = 0,10mm; for multi-starts = 0,20mm.

Preload max. 5% of max. dynamic load.

For axial run-out, concentricity and parallelism figures see technical pages.

With lubrication and fixing holes.

For use with ball screws no. L1375.

Tips

For miniature ball screws Ø6 to Ø14 see part no. L1379.

Important Notes

Fit ball nut to screw using the sleeve provided. Offer up the ball nut to the screw and slide carefully on. Do not remove the ball nut from the sleeve provided - the ball bearings can come loose rendering the ball nut unusable.

Ball Screws

Selecting a suitable size

Ball Screws

When selecting a ball screw some of the main factors to consider are:

- Maximum required travel speed
- Maximum axial compression (buckling load)
- Method of support of the ball screws
- Type of unit required, flanged, cylindrical etc.

In general it is best to support the ball screws with our ball screw support units (L1388 to L1406) with a fixed end (generally where the motor is mounted) and a floating (support) end. The support units are selected to suit the loads likely to be required, the size of the ball screw (especially its core diameter) and the type of mounting required. Details of the machining required for each end of the ball screw are shown in the bearing mounts technical section.

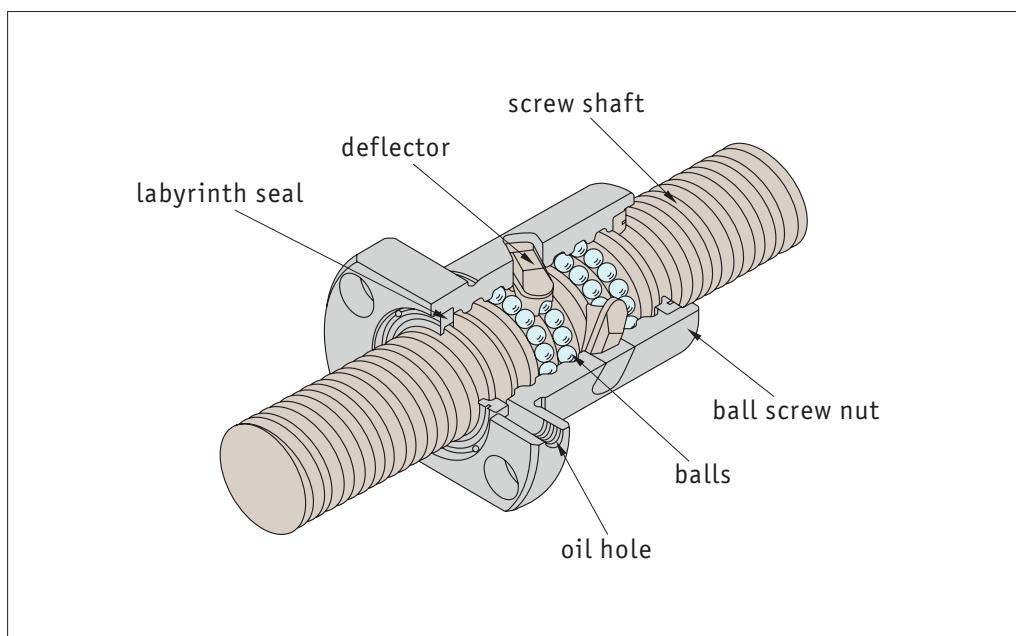

The data table for the ball screws show the diameter, the lead of the ball screw (i.e. how far the nut travels for one complete revolution of the screw) as well as the mass moment of inertia (also known as the rotational moment of inertia) - this is the extent to which an object resists rotational acceleration about its axis.

Maximum speeds and buckling load data are shown in the technical pages.

When using a ball screw the ambient temperature should not exceed +80°C.

During assembly, the parallel alignment of the guides should be ensure.

The details on the concentricity of the ball nuts to the ball screws are shown on the technical pages.
For linear guideways for use with ball screws please see our part numbers L1016 etc.

Lubrication - the ball screws must be adequately lubricated. This is dependent on load, speed, motion sequence and temperature. Do not use lubricants containing Mo/So or graphite.

Ball Screws from Automation Components

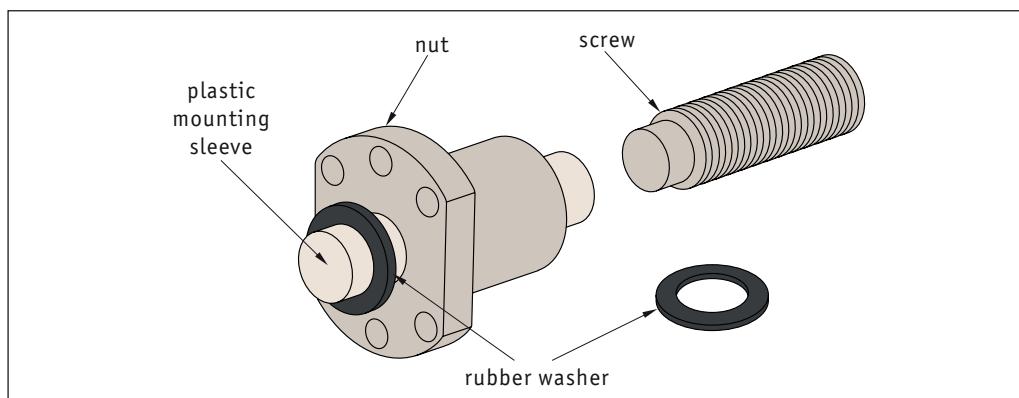

BALL SCREW & NUTS

In general, the ball nut is already on the ball screw and should not be removed. If you need to machine the ball screw, then the plastic mounting sleeve should be used to retain the ball bearings whilst the nut is removed.

Mounting the nut on the screw

Sometimes ball screws are delivered with a separate ball nut. When mounting the nut on to the screw take care as if done incorrectly the ball bearings may come off the ball nut.

Ball nuts should be mounted only with the help of a plastic mounting sleeve (delivered with the nut). The start of the thread should be aligned so that the seal and the internal parts of the nut are not damaged.

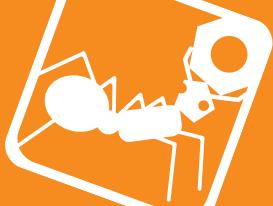

1. Remove the rubber washer from one side of the sleeve. Push on the nut with the sleeve on the end of the screw. Press the sleeve against the start of the screw thread.
2. Screw the nut onto the thread using a slight axial pressure, then screw the nut on for its entire length.
3. Remove the mounting sleeve only when the nut is completely threaded on to the screw.
4. Lock the nut on to the screw (to prevent any unscrewing) using an O ring or similar - whilst installing the system.

If the balls do unfortunately escape...

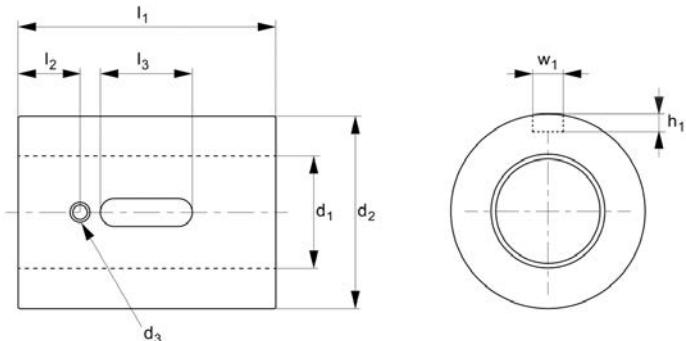

1. Pick them up (the nut is only compatible with the original balls). The load capacity can still be achieved if one or two balls are missing.
2. Carefully clean all parts, use the sleeve as a mounting jig and replace the balls.
3. Start with the lowest circuit. Insert the balls into the nut circuit - the sleeve prevents the balls from falling out again.
4. Do not place the balls in the empty circuit located between the two deflectors.

If you have any technical queries please call **0333 207 4498**.

Cylindrical Ball Nuts

Ball Screw & Nuts

L1373

BALL SCREW & NUTS

Material

Steel (16MnCr5 or 100Cr6), with Vulkolan seals.

Technical Notes

Axial play for 5mm pitch = 0,05mm; for 10mm pitch = 0,10mm; for multi-starts = 0,20mm.

Preload max. 5% of max. dynamic load.

For axial run-out, concentricity and parallelism figures see technical pages.
With lubrication and fixing holes.
For use with ball screws no. L1375.

Tips

For miniature ball screws Ø6 to Ø14 see part no. L1379.

L1375.16

Material

Steel (CF53 or C55R), induction hardened to 60 HRC ± 2 , polished.

Technical Notes

Gothic profile with a 5 or 10mm lead. Tolerance T7 - 50 μ /300mm. Shorter lengths or longer lengths up to a maximum

of 3000mm available.

For ball screw nuts see parts L1370-L1374 & L1377.

For end screw machining to suit ball screw supports units see relevant ball screw supports (L1388-L1406). End machining on request.

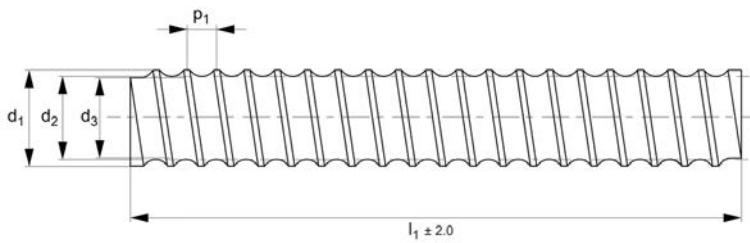

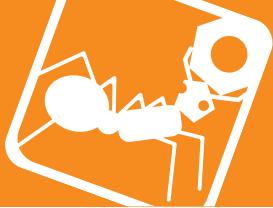

Important Notes

Ensure the ball nut can be fitted to the ball screw after machining. Do not remove the ball nut from the sleeve prior to installation - the balls come free rendering the ball nut unusable.

L1375.20

BALL SCREW & NUTS

Material

Steel (CF53 or C55R), induction hardened to 60 HRC ± 2 , polished.

Technical Notes

Gothic profile with a 5,20 or 50mm lead. Tolerance T7 - 50 μ /300mm. Shorter lengths or longer lengths up to a maximum of 3000mm available.

For ball screw nuts see parts L1370-L1374 & L1377.

For end screw machining to suit ball screw supports units see relevant ball screw supports (L1388-L1406). End machining on request.

Also available as a left hand thread for 5mm pitch.

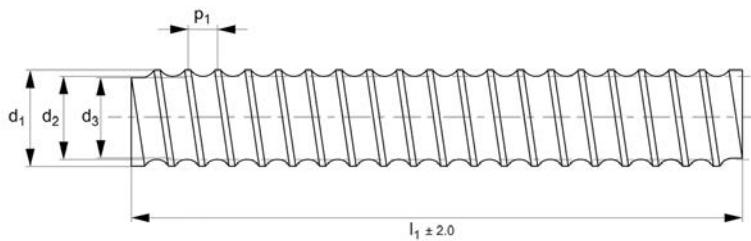

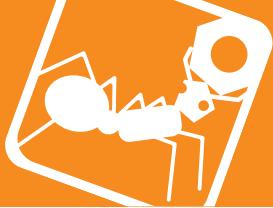

Important Notes

Ensure the ball nut can be fitted to the ball screw after machining. Do not remove the ball nut from the sleeve prior to installation - the balls come free rendering the ball nut unusable.

L1375.25

BALL SCREW & NUTS

Material

Steel (CF53 or C55R), induction hardened to 60 HRC ± 2 , polished.

Technical Notes

Gothic profile with a 5,10 or 2mm lead. Tolerance T7 - 50 μ /300mm. Shorter lengths or longer lengths up to a maximum

of 6000mm available.

For ball screw nuts see parts L1370-L1374 & L1377.

For end screw machining to suit ball screw supports see relevant ball screw supports (L1388-L1406). End machining on request.

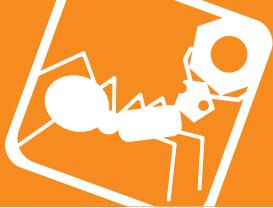

Important Notes

Ensure the ball nut can be fitted to the ball screw after machining. Do not remove the ball nut from the sleeve prior to installation - the balls come free rendering the ball nut unusable.

BALL SCREW & NUTS

Material

Steel (CF53 or C55R), induction hardened to 60 HRC ± 2 , polished.

Technical Notes

Gothic profile with a 5,10,20 or 40mm lead.

Tolerance T7 - $50\mu/300\text{mm}$. Shorter lengths or longer lengths up to a maximum

of 6000mm available.

For ball screw nuts see parts L1370-L1374 & L1377.

For end screw machining to suit ball screw supports units see relevant ball screw supports (L1388-L1406). End machining on request.

Also available as a left hand thread for

5mm pitch.

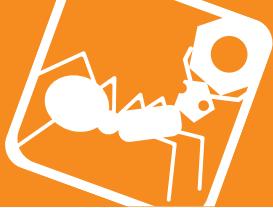

Important Notes

Ensure the ball nut can be fitted to the ball screw after machining. Do not remove the ball nut from the sleeve prior to installation - the balls come free rendering the ball nut unusable.

Ø 40 Ball Screws

rolled

Ball Screw & Nuts

L1375.40

BALL SCREW & NUTS

Material

Steel (CF53 or C55R), induction hardened to 60 HRC ± 2 , polished.

Technical Notes

Gothic profile with a 5, 10 or 20mm lead. Tolerance T7 - 50 μ /300mm. Shorter lengths or longer lengths up to a maximum

of 6000mm available.

For ball screw nuts see parts L1370-L1374 & L1377.

For end screw machining to suit ball screw supports see relevant ball screw supports (L1388-L1406). End machining on request.

Important Notes

Ensure the ball nut can be fitted to the ball screw after machining. Do not remove the ball nut from the sleeve prior to installation - the balls come free rendering the ball nut unusable.

Ø 50 Ball Screws

rolled

Ball Screw & Nuts

L1375.50

BALL SCREW & NUTS

Material

Steel (CF53 or C55R), induction hardened to 60 HRC ± 2 , polished.

Technical Notes

Gothic profile with a 10 or 20mm lead. Tolerance T7 - 50 μ /300mm. Shorter lengths or longer lengths up to a maximum

of 6000mm available.

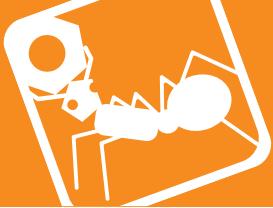

For ball screw nuts see parts L1370-L1374 & L1377.

For end screw machining to suit ball screw supports units see relevant ball screw supports (L1388-L1406). End machining on request.

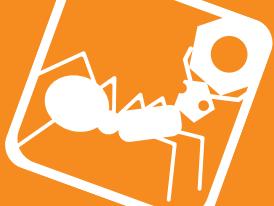

Important Notes

Ensure the ball nut can be fitted to the ball screw after machining. Do not remove the ball nut from the sleeve prior to installation - the balls come free rendering the ball nut unusable.

Ø 80 Ball Screws

rolled

Ball Screw & Nuts

L1375.80

BALL SCREW & NUTS

Material

Steel (CF53 or C55R), induction hardened to 60 HRC ± 2 , polished.

Technical Notes

Gothic profile with a 10mm lead.
Tolerance T7 - 50 μ /300mm. Shorter lengths or longer lengths up to a maximum

of 6500mm available.

For ball screw nuts see parts L1370-L1374 & L1377.

For end screw machining to suit ball screw supports see relevant ball screw supports (L1388-L1406). End machining on request.

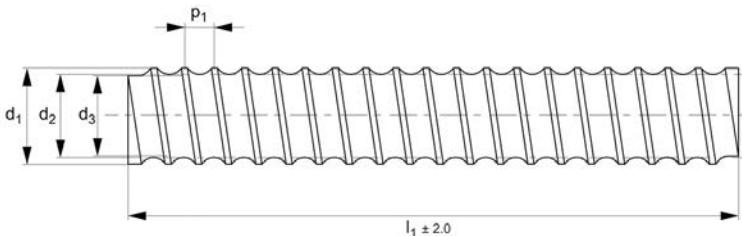

Important Notes

Ensure the ball nut can be fitted to the ball screw after machining. Do not remove the ball nut from the sleeve prior to installation - the balls come free rendering the ball nut unusable.

Flanged Ball Nuts- Anti corrosion

DIN 69051, form B

Ball Screw & Nuts

L1377

BALL SCREW & NUTS

Material

Black chrome steel (16MnCr5 or 100Cr6), with Vulkolan seals. Precision class C7.

Technical Notes

Axial play for 5mm pitch = 0,05mm; for 10mm pitch = 0,10mm; for multi-starts = 0,20mm.

Preload max. 5% of max. dynamic load. For axial run-out, concentricity and paral-

lelism figures see technical pages.

With lubrication and fixing holes.

For use with ball screws no. L1377.

Anti corrosion finish consists of a thin layer of black chrome and produces good resistance to wear, and a protective effect against corrosion. Layer thickness 2-10µm.

see the nut bracket - part L1377.

Important Notes

Fit ball nut to screw using the sleeve provided. Offer up the ball nut to the screw and slide carefully on. Do not remove the ball nut from the sleeve provided - the ball bearings can come loose rendering the ball nut unusable.

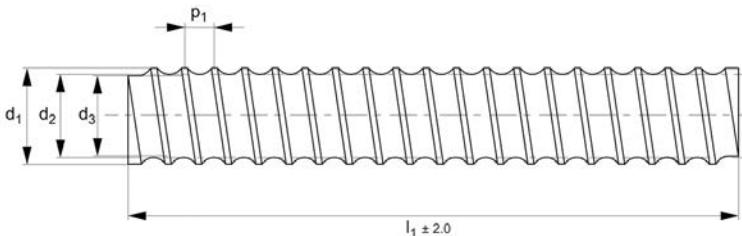

Tips

For easy mounting of the ball screw nuts

L1377.16

**Material**

Black chrome steel (CF53 or C55R), induction hardened to 60 HRC ± 2 , polished.

Technical Notes

Gothic profile with a 5 or 10mm lead. Tolerance T7 - 50 μ /300mm. Shorter lengths or longer lengths up to a maximum of 6000mm available.

For ball screw nuts see part L1377.

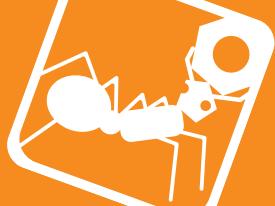

For end screw machining to suit ball screw support units see relevant ball screw supports (L1388-L1406). End machining on request. Anti corrosion finish consists of a thin layer of black chrome and produces good resistance to wear, and a protective effect against corrosion. Layer

thickness 2 μ m to 10 μ m.

Important Notes

Ensure the ball nut can be fitted to the ball screw after machining. Do not remove the ball nut from the sleeve prior to installation - the balls come free rendering the ball nut unusable.

Ø 20 Ball Screws- Anti Corrosion

rolled

Ball Screw & Nuts

L1377.20

BALL SCREW & NUTS

Material

Black chrome steel (CF53 or C55R), induction hardened to 60 HRC ± 2 , polished.

Technical Notes

Gothic profile with a 5,20 or 50mm lead. Tolerance T7 - 50 μ /300mm. Shorter lengths or longer lengths up to a maximum of 6000mm available.

For ball screw nuts see part L1377.

For end screw machining to suit ball screw support units see relevant ball screw supports (L1388-L1406). End machining on request.

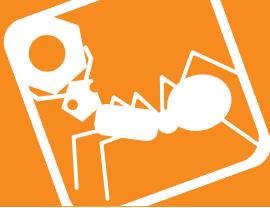

Also available as a left hand thread for 5mm pitch. Anti corrosion finish consists of a thin layer of black chrome and produces good resistance to wear, and a protective effect against corrosion. Layer

thickness 2 μ m to 10 μ m.

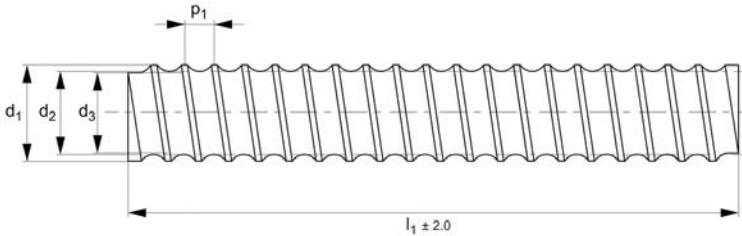

Important Notes

Ensure the ball nut can be fitted to the ball screw after machining. Do not remove the ball nut from the sleeve prior to installation - the balls come free rendering the ball nut unusable.

L1377.25

Material

Black chrome steel (CF53 or C55R), induction hardened to 60 HRC ± 2 , polished.

Technical Notes

Gothic profile with a 5, 10 or 2mm lead. Tolerance T7 - 50 μ /300mm. Shorter lengths or longer lengths up to a maximum of 6000mm available.

For ball screw nuts see part L1377.

For end screw machining to suit ball screw support units see relevant ball screw supports (L1388-L1406). End machining on request. Anti corrosion finish consists of a thin layer of black chrome and produces good resistance to wear, and a protective effect against corrosion. Layer

thickness 2 μ m to 10 μ m.

Important Notes

Ensure the ball nut can be fitted to the ball screw after machining. Do not remove the ball nut from the sleeve prior to installation - the balls come free rendering the ball nut unusable.

Ø 32 Ball Screws- Anti Corrosion

rolled

Ball Screw & Nuts

L1377.32

BALL SCREW & NUTS

Material

Black chrome steel (CF53 or C55R), induction hardened to 60 HRC ± 2 , polished.

Technical Notes

Gothic profile with a 5,10,20 or 40mm lead.
Tolerance T7 - 50 μ /300mm. Shorter lengths or longer lengths up to a maximum of 6000mm available.

For ball screw nuts see part L1377.

For end screw machining to suit ball screw support units see relevant ball screw supports (L1388-L1406). End machining on request.

Also available as a left hand thread for 5mm pitch. Anti corrosion finish consists of a thin layer of black chrome and produces good resistance to wear, and a

protective effect against corrosion. Layer thickness 2 μ m to 10 μ m.

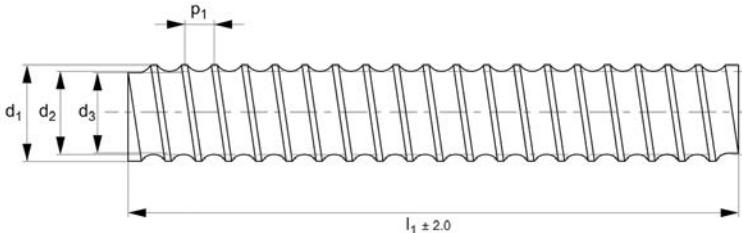

Important Notes

Ensure the ball nut can be fitted to the ball screw after machining. Do not remove the ball nut from the sleeve prior to installation - the balls come free rendering the ball nut unusable.

Miniature Cylindrical Ball Nut

Ball Screw & Nuts

L1379.C

BALL SCREW & NUTS

Material

Steel body (16MnCr5), balls (100Cr6) and polyurethane (Vulkolan) seals.

Technical Notes

Axial clearance 0,05mm.

Preload max. 5% of dynamic load.

For axial run-out, concentricity and parallelism figures see technical pages.

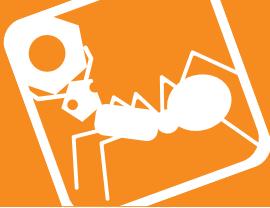

For use with miniature ball screws L1379.

Tips

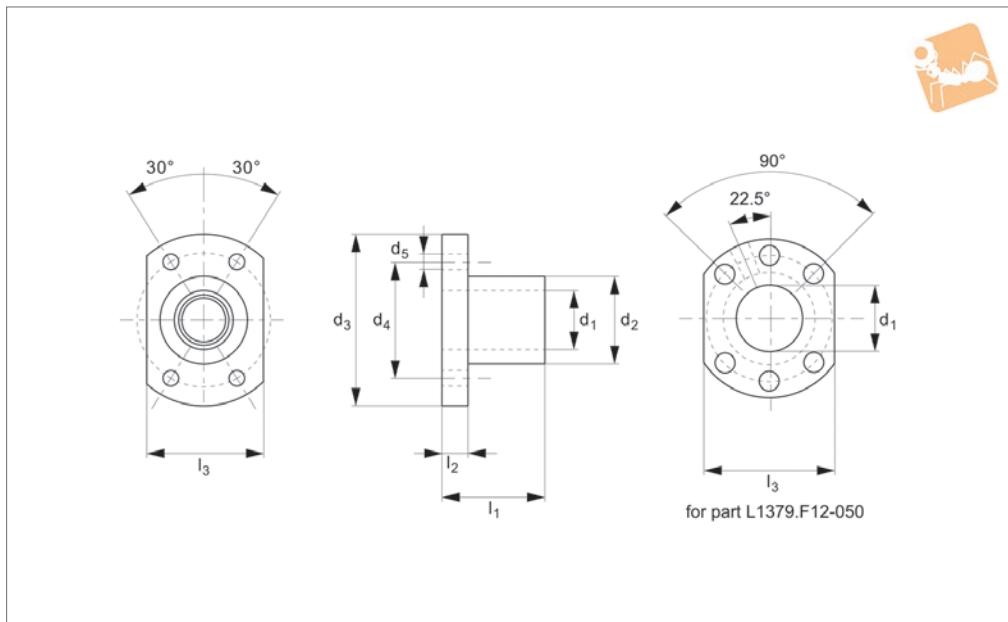

Fit ball nut to screw using the sleeve provided. Offer up the ball nut to the screw

and slide carefully on. Do not remove the ball nut from the sleeve provided - the ball bearings can come loose rendering the ball nut unusable.

BALL SCREW & NUTS

Material

Steel (Cf53 or C55R), hardened, rust proof chrome plated (X90CrMoV5).

Technical Notes

Tolerance T7 - 50 μ /300mm.

For ball screw nuts L1379.F (flanged) and L1379.C (cylindrical).

For end machining of ball screws to suit miniature or standard ball screw support units please see technical pages.

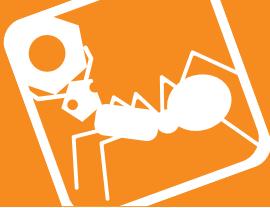

We provide a service to cut and machine ball screws as required.

Chrome plating for use in food industry etc. contains 98% pure chromium.

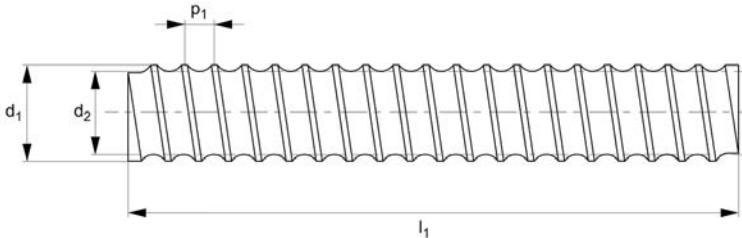

Tips

Do not remove the ball nut from the sleeve that it comes with prior to installation - the balls come free rendering the ball nut unusable. Offer up the ball nut still on its mounting sleeve to the ball screw and screw carefully on.

10Ø Miniature Rolled Ball Screw

Ball Screw & Nuts

L1379.10

BALL SCREW & NUTS

Material

Steel (Cf53 or C55R), hardened, rust proof chrome plated (X90CrMoV5).

Technical Notes

Tolerance T7 - 50 μ /300mm.

For ball screw nuts see parts L1379.F and L1379.C.

For end machining of ball screws to suit miniature or standard ball screw support units please see technical pages.

We provide a service to cut and machine ball screws as required.

Chrome plating for use in food industry etc. contains 98% pure chromium.

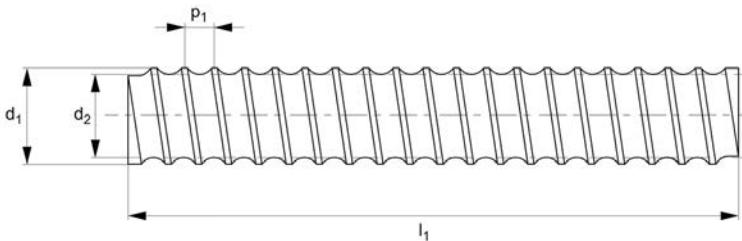

Tips

Do not remove the ball nut from the sleeve that it comes with prior to installation - the balls come free rendering the ball nut unusable. Offer up the ball nut still on its mounting sleeve to the ball screw and screw carefully on.

L1370.L

Material

Steel (16MnCr5 or 100Cr6), with Vulkolan seals.

Technical Notes

To DIN 69051 form B.

Axial play for 5mm pitch = 0,05mm; for 10mm pitch = 0,10mm; for multi-starts = 0,20mm.

Preload max. 5% of max. dynamic load.

For axial run-out, concentricity and parallelism figures see technical pages.

With lubrication and fixing holes.

For use with ball screws no. L1375.

Tips

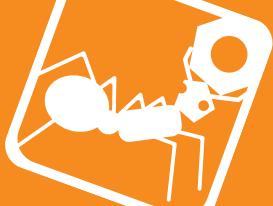

For easy mounting of the ball screw nuts see the nut bracket - part L1377.

For miniature ball screws Ø6 to Ø14 see part no. L1379.

Important Notes

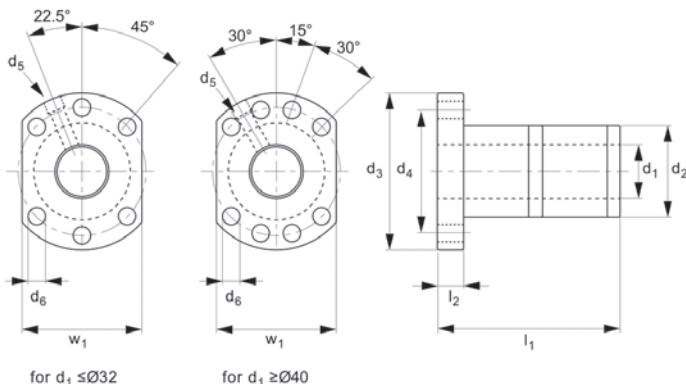

Fit ball nut to screw using the sleeve provided. Offer up the ball nut to the screw and slide carefully on. Do not remove the ball nut from the sleeve provided - the ball bearings can come loose rendering the ball nut unusable.

**L1375.16L****Material**

Steel (CF53 or C55R), induction hardened to 60 HRC ± 2 , polished.

Technical Notes

Gothic profile with a 5 or 10mm lead. Tolerance T7 - 50 μ /300mm. Shorter lengths or longer lengths up to a maximum of 3000mm available.

For ball screw nuts see parts L1370.L& L1371.L - these are left hand nuts.

For end screw machining to suit ball screw support units see relevant ball screw supports (L1388-L1406). End machining on request.

Tips

These are non-standard left hand thread

ball screws.

Important Notes

Ensure the ball nut can be fitted to the ball screw after machining. Do not remove the ball nut from the sleeve prior to installation - the balls come free rendering the ball nut unusable.

Left Hand Ø 20 Ball Screws

rolled

Ball Screw & Nuts

L1375.20L

BALL SCREW & NUTS

Material

Steel (CF53 or C55R), induction hardened to 60 HRC ± 2 , polished.

Technical Notes

Gothic profile with a 5,20 or 50mm lead. Tolerance T7 - 50 μ /300mm. Shorter lengths or longer lengths up to a maximum of 3000mm available.

For ball screw nuts see parts L1370.L &

L1371.L - these are left hand nuts.

For end screw machining to suit ball screw support units see relevant ball screw supports (L1388-L1406). End machining on request.

Also available as a left hand thread for 5mm pitch.

Tips

These are non-standard left hand thread

ball screws.

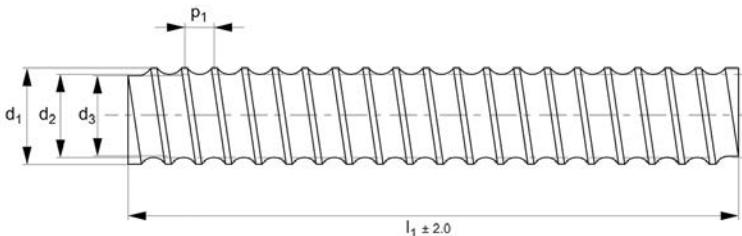

Important Notes

Ensure the ball nut can be fitted to the ball screw after machining. Do not remove the ball nut from the sleeve prior to installation - the balls come free rendering the ball nut unusable.

Fixed Rectangular Support Units (AK)

for ball & lead screws

Bearing
Supports

L1388

BEARING SUPPORTS

Material

Steel with black oxide finish.

Bearings, sealed and lubricated for life.

Technical Notes

Standard units are suitable for ball screws and lead screws to C5/C7 accuracy grade.

The bearings are not preloaded and have a maximum axial clearance of 18μ .

For dimensions to machine the ends of the screws see technical pages.

bearing mounts are available for clean room and other applications. **For lead screw sizes up to 80 and ball screw sizes up to 63 see part no. L1392.**

Tips

Fixed Round Support Units (FKA)

for ball & lead screws

**Bearing
Supports**

L1400

BEARING SUPPORTS

Material

Steel with black oxide finish.
Bearings, sealed and lubricated for life.

Technical Notes

Standard units are suitable for ball screws

and lead screws to C5/C7 accuracy grade.

The bearings are not preloaded and have a max. axial clearance of 0,018mm.

For dimensions to machine the ends of the screws to see technical pages.

Tips

Electroless nickel plated versions of these bearing mounts are available for clean room and other applications.

Heavy Load Support Units (WBK)

for ball & lead screws

BEARING SUPPORTS

**L1405****Material**

Steel with black oxide finish.

Bearings, sealed and lubricated for life.

Technical Notes

These supports come with a pair of duplex

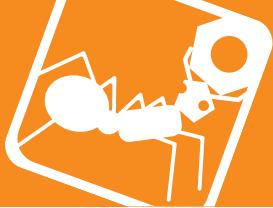

angular contact bearings (type A), three angular bearings (type B), or four angular contact bearings (type C), for a true fixed support.

For dimensions to machine the ends of the

screw to see technical pages.

Technical Information

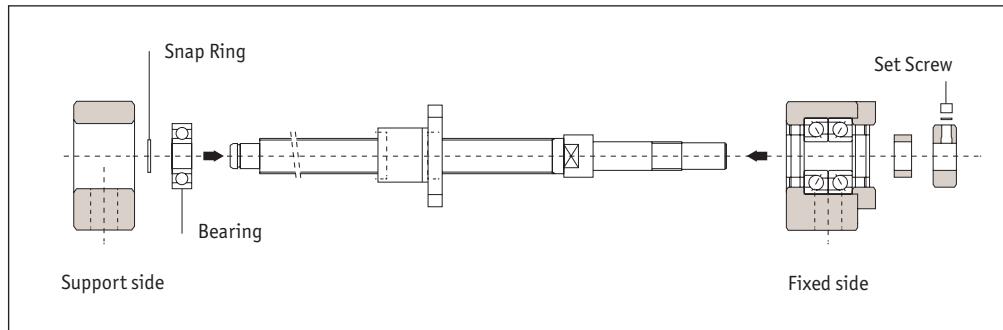

Bearing supports mounting procedures

Bearing Supports

Installing the support unit

1. Install the fixed side support unit to the screw shaft.
2. After inserting the fixed side support unit, secure the lock nut using the fastening set piece and the hexagonal socket head set screw.
3. Attach the support side bearing to the screw shaft and secure the bearing using the snap ring, and then install the assembly to the housing on the supported side.

Notes

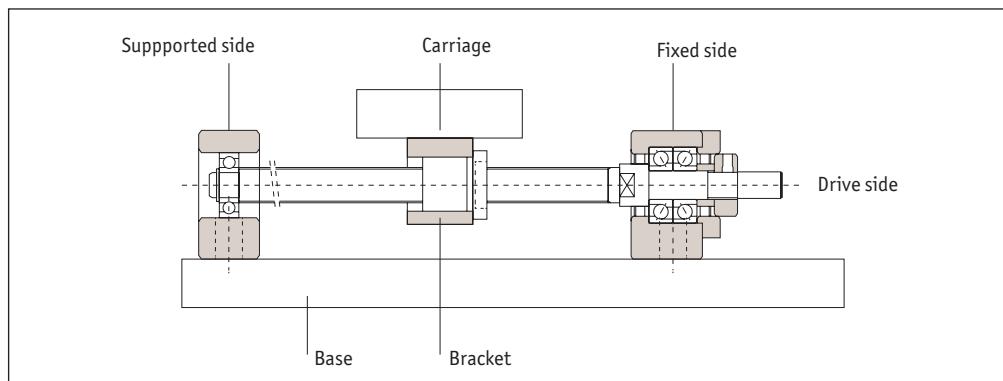

When inserting the screw shaft to the support unit, take care not to let the oil seal lip turn upward.

When securing the set piece with a hexagonal socket head set screw, apply an adhesive to the hexagonal socket head set screw before tightening it in order to prevent the screw from loosening. If planning to use the product in a harsh environment, it is also necessary to take measures to prevent other components/parts from loosening. Contact our Technical Department for details.

BEARING SUPPORTS

Installation onto the table and the base

1. If using a bracket when mounting the ball screw nut to the carriage, insert the nut into the bracket and temporarily fasten it.
2. Temporarily fasten the fixed side support unit to the base. In doing so, press the table toward the fixed side support unit to align the axial centre, and adjust the carriage so that it can travel freely.
3. Press the carriage toward the fixed side support unit to align the axial centre. Make the adjustment by reciprocating the table several times so that the nut travels slowly over the whole stroke, and temporarily secure the support unit to the base.

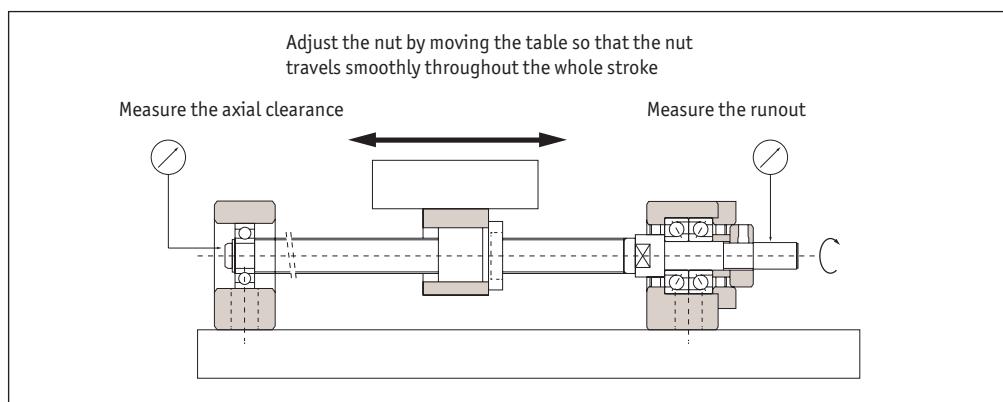

Notes

If using the fixed side support unit as the reference point, secure a clearance between the ball screw nut and the table or inside the bracket when making adjustment.

If using the table as a reference point, make the adjustment either by using the shim (for a square type support unit), or securing the clearance between the outer surface of the nut and the inner surface of the mounting section (for a round type support unit).

Checking the accuracy and fully fastening the support unit

1. While checking the runout of the ball screw shaft end and the axial clearance using a dial gauge, fully fasten the ball screw nut, the nut bracket, the fixed side support unit and the support side unit, in this order.

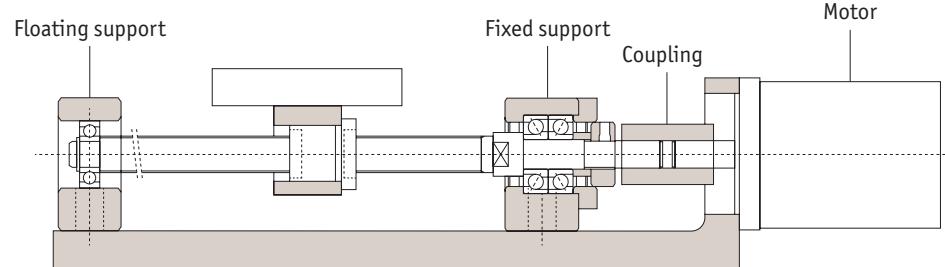

Bearing Supports from Automation Components

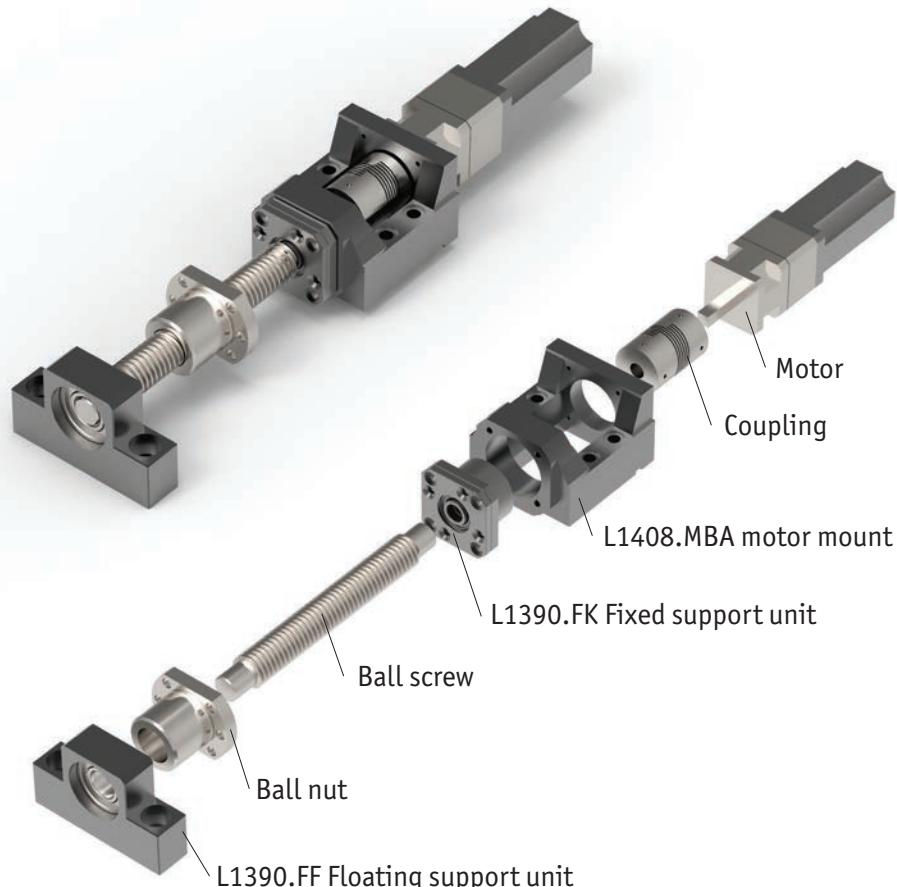

BEARING SUPPORTS

Connection with motor

1. Mount motor bracket to the base.
2. Connect the motor and the ball screw using a coupling (make sure the mounting accuracy is maintained).
3. Mount motor bracket to the base.

The fixed support unit is always positioned at the end where the motor/handwheel is.

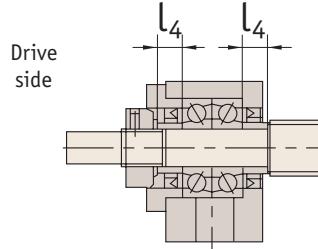

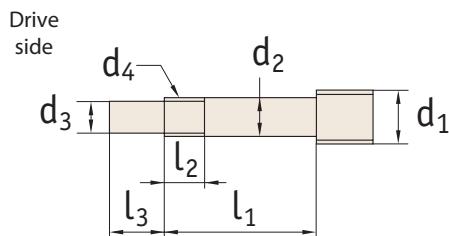

Technical Information

Fixed side for unit types; FK, EK, AK, FKA and LK
