When one single joint is coupled with two shafts (of which the driving one is rotating at a constant speed) forming an angle, a periodic variation of the driven shaft is caused with exactly four fluctuations per revolution.

The difference between the maximum and the minimum speed of the driven shaft depends on the angle formed by the two shafts. The difference grows with the increase of the angle  $\alpha^\circ$ . To have a smooth transmission, either two opposite single joints (ensuring that the two central yokes lie on the same plane and the angles are equal) or a double joint need to be fitted. The irregularity caused by the articulation of the first unisex joint is cancelled by the second unisex joint. The overall length resulting from the coupling of the two single joints can be reduced by using a double unisex joint. In other words, the double joint is to be considered as the shortest method of achieving smooth transmission.

For low speed applications (max. 1000 rpm), joints with plain bearings are recommended. They are able to support shock loads, motion reversal, irregular running and relatively high torques. The working angles must be restricted when using at speeds between 500 - 1000 rpm. Please consult our technical department if you have such an application.

For high rotation speeds, relatively low torques or wide angles, joints with needle roller bearings are preferred. They can reach 4000 rpm dependent on the angle.

### How to read diagrams

The joints capacity to transmit a regular torque at a constant load with no shocks, for a long period, mainly depends on the number of revolutions per minute and the inclination angle  $a^\circ$  of the two axes. The diagrams on the following pages are based on this. Each curve corresponds to the joint size (outside diameter "D") and represents the torque that the joint can transmit depending on speed and working angle  $a^\circ$ .

The diagrams can be directly read if angle ( $a^\circ$ ) is  $10^\circ$ . For wider angles, torques are reduced, these should be corrected using the correction vales (F) relating to the angle shown in the table.

### IMPORTANT

Graph values are merely indicative and refer to the single joints only. When choosing a double joint, you have to consider that they can transmit a torque about 10% lower than the same sized single joints. Each application has its own particular motion characteristics, such as: shock loads, motion reversals, connected masses, kind of starting, presence of elastic joints, stops and starts, etc., that have to be considered when choosing the joint.

Working angle $a^\circ$	Correction value F
$5^\circ$	1,25
$10^\circ$	1,00
$15^\circ$	0,80
$20^\circ$	0,65
$25^\circ$	0,55
$30^\circ$	0,45
$35^\circ$	0,38
$40^\circ$	0,30
$45^\circ$	0,25

### Torque Calculation for Plain Bearings

Power: 0,65 KW, RPM: 230

With working angle  $10^\circ$  Value  $F = 1$  we get point P. Torque = 27 Nm corresponding to joint size "D" = 25/26mm. = Types R3688.016 and R3689.012

With working angle  $30^\circ$  Value  $F = 0.45$  (Kw 0,65: 0,45 = 1,44Kw) we get point P1 Torque = 60 Nm corresponding to joint size "D" = 32mm. = Types R3688.020 and R3689.016

Consider that:

$$\text{Torque in Nm} = 9550 \times \frac{\text{Power (KW)}}{\text{RPM}}$$

$$\text{Torque in Nm} = 7020 \times \frac{\text{Power (HP)}}{\text{RPM}}$$

Note: 1 KW = 1,35 HP and HP = 0,736 KW

Note: 1 Kgm = 9,81 Nm and Nm = 0,102 Kgm

### Torque Calculation

With working angle a 10° Value F = 1 we get point P. Torque = 23 Nm corresponding to joint size "D" = 28mm. = Type R3686.014

With working angle a 25° Value F = 0.70 (Kw 5,5: 0,70 = 7,85Kw) we get point P1 Torque = 33 Nm corresponding to joint size "D" = 32mm. = Type R3686.016

All of our rod ends incorporate either a plain spherical bearing, ball bearing, or roller bearing. Below is an overview of each type.

### Plain spherical bearings

- A** Made from Polyamid-PTFE-fibreglass-compound, maintenance free, absorbs any foreign particles
- B** Ball made of bearing steel, hardened, ground, polished and hard chromium plated, ensures reliable corrosion protection
- C** No clearance - radial clearance 0-10µm
- D** All rod ends housings made of forged steel, tempered, extremely high loads resistant

### Ball and roller bearings

- A** Radial clearance: 10-30µm, low friction
- B** Inner ring made of bearing steel, hardened ball grooves polished
- C** Shields on both sides protect against rough dirt penetration
- D** All rod ends housings are made of forged steel, case hardened bearing race
- E** Low maintenance due to long-term greasing, especially suitable for high speed large swiveling angles or rotating movements

### Rod ends and water

#### Stainless steel versions

Most of our rod ends are available in stainless steel as standard

High grade AISI 316 stainless steel available on request

#### Rod ends with integral maintenance-free spherical plain bearings

In many cases heavy-duty rod ends with integral spherical plain bearings are most often used. They are above all used for small swivelling or tilting movements at low speeds. They stand out for their high load capacity and can also be used for shock-like loads. The rod end ball slides on a plastic bearing shell consisting of a glass fibre-filled nylon/teflon compound. This design assures a maintenance-free rod end. Heavy-duty plain bearing rod ends have slight initial movement friction and virtually no clearance. The plastic material used has another advantage in that it can absorb many foreign particles so that no damage can occur. The balls of heavy-duty rod ends with integral spherical plain bearings are hard chrome plated. This reliable corrosion protection ensures that the function of the rod end will not be affected by a corroded ball surface under humid operating conditions.

#### Rod ends with integral ball bearings

This design is especially suitable for high speeds, large swivelling angles or rotating movements with relatively low or medium loads. Prominent technical features are the low bearing friction, long-time greasing as well as the sealing against some dirt penetration (by means of shields on both sides). Under normal operating conditions the rod ends are maintenance-free.

Greasing nipples are provided for lubrication in case of rough operations and maximum loads. To avoid incompatibility with the production lubrication, we recommend lubrication with a calcium-complex-soap-grease. A special heat treatment procedure gives the rod end housing a raceway hardness adapted to the antifriction bearing, ensuring at the same time high stability with changing loads.

#### Rod ends with integral roller bearings

This design based on the structure of a self-aligning roller bearing is preferably used for high speed, large tilting angles or rotating movements under high loads. Compared to rod ends with ball bearings, rod ends with self-aligning roller bearings have essentially higher basic load ratings. This design is equipped with a cage to minimise the rolling friction and heat build-up. These rod ends, with long-time lubrication are under normal operating conditions maintenance-free.

Greasing nipples are provided for lubrication in case of rough operations and maximum loads. To avoid incompatibility with the production lubrication, we recommend lubricating with a calcium-complex-soap-grease.

Shields on both sides limit dirt particles from penetrating into the bearing. The rod ends with roller bearings are, subjected to a special heat treatment to obtain a raceway hardness adapted to the antifriction bearings, ensuring at the same time a high stability with changing loads.

### Static load capacity $C_0$ (plain bearings)

The static load capacity  $C_0$  is the radially acting static load which does not cause any permanent deformation of the components when the spherical bearing or rod end is stationary, (i.e. the load condition without pivoting, swivelling or tilting movements).

It is also a precondition here that the operating temperature must be at normal room temperature and the surrounding components must possess sufficient stability.

The values specified in the tables are determined by static tension tests on a representative number of series components at 20°C normal room temperature. The static load capacity may vary with lower or higher temperature depending on the material.

In the case of all rod ends with plain bearings, the static load rating refers to the maximum permissible static load of the rod end housing in a tensile direction up to which no permanent deformation occurs at the weakest housing cross-section. The value in the product tables has a safety factor of 1.2 times the tensile strength of the rod ends housing material.

### Static load capacity $C_0$ (roller and ball bearings)

For our rod ends with roller and ball bearings, the static load rating is the load at which the bearing can operate at room temperature without its performance being impaired as a result of deformations, fracture, or damage to the sliding contact surfaces (max 1/10,000<sup>th</sup> of the ball diameter).

### Dynamic load capacity $C$ (plain bearings)

Dynamic load ratings serve as values for calculation of the service life of dynamically-loaded spherical bearings and rod ends. The values themselves do not provide any information about the effective dynamic load capacity of the spherical bearing or rod end. To obtain this information, it is necessary to take into account the additional influencing factors such as load type, swivel or tilt angle, speed characteristic, max. permitted bearing clearance, max. permitted bearing friction, lubrication conditions and temperature, etc.

Dynamic load capacities depend on the definition used to calculate them. Comparison of values is not always possible owing to the different definitions used by various manufacturers, and because the load capacities are often determined under completely different test conditions.

### Dynamic load capacity $C$ (roller and ball bearings)

For our rod ends with roller and ball bearings, the dynamic load capacity is the load at which 90% of a large quantity of identical rod ends reach 1 million revolutions before they fail (due to fatigue of the rolling surfaces).

**Permissible load**

The maximum load is defined by the static basic load rating  $C_0$ . If static loads are a combination of radial and axial loads, the equivalent static load will have to be calculated.

Permissible load:

$$P_0 \leq C_0 \text{ (N)}$$

Where:  $P_0$  = Static equivalent load (kN)

Self-aligning ball bearing =  $P_0 = F_r + Y_0 \cdot F_a$

Self-aligning roller bearing =  $P_0 = F_r + 5 \cdot F_a$

$F_a$  = Axial load

$F_r$  = Radial load

$Y_0$  = Axial factor, static, see individual product pages

$C_0$  = Basic static load rating (kN), see individual product pages

**Nominal service life**

Rod Ends with integral self-aligning ball bearing R3556, R3557, R3559, R3560, R3563, R3564.

Rotating:

$$G_{h_{rot.}} = 10^6 \frac{\left(\frac{C}{P}\right)^3}{60 \cdot n} \text{ (h)}$$

Oscillating:

$$G_{h_{osc.}} = 10^6 \frac{\left(\frac{C}{P \sqrt[3]{\frac{\beta}{90}}}\right)^3}{60 \cdot f} \text{ (h)}$$

Where:  $P$  = Dynamic equivalent load (kN)

Self-aligning ball bearing =  $P = F_r + Y \cdot F_a$

Self-aligning roller bearing =  $P = F_r + 9.5 \cdot F_a$

$C$  = Basic dynamic load (kN), see individual product pages

$Y$  = axial factor, dynamic, see individual product pages

$G_{h_{rot.}}$  = nominal service life for rotation (hours of operation)

$G_{h_{osc.}}$  = nominal service life for rotation (hours of operation)

$\beta$  = half of swivelling angle (degree),  $\beta = 90$  should be used for rotation. **Condition:** Swivelling angle  $\beta \leq 3^\circ$ . For swivelling angles  $\beta < 3^\circ$  we recommend the use of heavy-duty spherical plain bearing rod ends

$n$  = rotation speed (rpm)

$f$  = frequency of oscillation (rpm)

$h$  = hours

#### Nominal service life

Rod ends with integral self-aligning roller bearing R3561, R3562.

Rotating:

$$G_{h_{rot.}} = 10^6 \frac{\left(\frac{C}{P}\right)^{3,333}}{60 \cdot n} \text{ (h)}$$

Oscillating:

$$G_{h_{osc.}} = 10^6 \frac{\left(\frac{C}{P \sqrt[3]{\frac{\beta}{90}}}\right)^{3,333}}{60 \cdot f} \text{ (h)}$$

See table on page 114 for key to symbols

#### Calculation example

At the rotating side of a crank mechanism a ball or roller bearing rod end should be installed. The expected service life amounts to at least 5000 hours.

Known: rotation speed  $n = 300$  rpm, radial load  $F_r = 0,75$  kN

Selected: R3557.R008 = 4,0 kN

$$\begin{aligned} G_{h_{rot.}} &= 10^6 \frac{\left(\frac{C}{P}\right)^3}{60 \cdot n} \\ &= 10^6 \frac{\left(\frac{4,0}{0,75}\right)^3}{60 \cdot 300} = \underline{\underline{8428 \text{ h} > 5000 \text{ h}}} \quad \checkmark \end{aligned}$$

**Permissible load**

The maximum permissible load is calculated by using equation 1. If static loads are a combination of radial and axial loads, the equivalent static load will have to be calculated using equation 2.

Permissible load:

Equation 1  $P_{max.} = C_0 \cdot C_2 \cdot C_4$

Equation 2  $P = F_r + F_a \leq P_{max.}$

- Where:  $P_{max}$  = Maximum permissible load (kN)  
 $C_0$  = static basic load (kN), see individual product pages  
 $C_2$  = Temperature factor, see below  
 $C_4$  = Factor for type of load, see below  
 $P$  = Equivalent dynamic load (kN)  
 $F_r$  = Radial load  
 $F_a$  = Axial load (kN), **condition:**  $F_a \leq 0.2 \cdot F_r$

Load factor  $C_4$ :

Constant:

$C_4$ :

1,0

Pulsating:

0,3

Alternating:

0,2

Temperature factor  $C_2$ :

Up to 60°C	1,0
60°C to 80°C	0,8
80°C to 100°C	0,7
100°C to 120°C	0,8

#### Permissible sliding velocity

The permissible sliding velocity of heavy-duty rod ends mainly depends on the load and temperature conditions. Heat generated by friction in the rod end housing is the main limitation on sliding velocity. When selecting the rod end size, it is necessary to determine the sliding velocity and the pv-value, which is a product of the specific bearing load  $p$  (N/mm<sup>2</sup>) and the sliding velocity  $v$  (m/s).

Specific bearing load:

$$p = k \cdot \frac{P}{C}$$

Permissible pv-value = 0,5 N/mm<sup>2</sup> · m/s

- Where: P = Specific bearing load (N/mm<sup>2</sup>)  
 C = Basic dynamic load rating (N), see individual product pages  
 k = Specific load factor (N/mm<sup>2</sup>) for tribological pairing  
 k = 50 N/mm<sup>2</sup>

Mean sliding velocity:

$$V_m = 5,82 \cdot 10^{-7} \cdot d_3 \cdot \beta \cdot f$$

Permissible sliding velocity  $v_{max.} = 0,15$  m/s

- Where:  $V_m$  = Mean sliding velocity (m/s)  
 $d_3$  = Pivot ball diameter (mm), see individual product pages  
 $\beta$  = Half swivelling angle (degree), for swivelling angle > 180°  
 $\beta = 90^\circ$  to be used  
 f = Frequency of oscillation (rpm)

Nominal service life:

$$G = C_1 \cdot C_2 \cdot C_3 \cdot \frac{3}{d_3 \cdot \beta} \cdot \frac{C}{P} \cdot 10^8$$

$$G_h = C_1 \cdot C_2 \cdot C_3 \cdot \frac{5}{d_3 \cdot \beta \cdot f} \cdot \frac{C}{P} \cdot 10^6$$

- Where: G = Nominal service life (number of oscillations or revolutions)

Alternating load direction at  $f > 30$  rpm:  $C_1 = 0,125$

Alignment:

To find  $C_3$  calculate  $C_2 \cdot \frac{C}{P}$  then using this value on the chart below, read across to  $C_3$

 $C$  = basic dynamic load rating (N) see individual product pages  
 $P$  = Specific bearing load (N/mm<sup>2</sup>)

### Calculation example

The rod end assembly of conveyor equipment calls for heavy-duty rod end with a service life of 7000 hours in conjunction with an alternating acting load of 5 kN. 25 swivelling moments with a swivelling angle of 20° take place per minute. The operating temperature amounts to approx. 60° C. The choice is a heavy-duty rod end R3554.R015 with: C = 13,4 kN, d<sub>3</sub> = 22mm.

Checking the permissible load of the rod end:

$$P_{\max.} = C_0 \cdot C_2 \cdot C_4$$

$$P_{\max.} = 41 \cdot 0,2 \cdot 1,0 = 8,2 \text{ kN} > 5,0 \text{ kN}$$

Where: C<sub>0</sub> = 41 kN  
 C<sub>2</sub> = 1,0 (temperature 60° C)  
 C<sub>4</sub> = 0,2 (alternating load)

Checking the permissible sliding velocity:

$$V_m = 5,82 \cdot 10^{-7} \cdot d_3 \cdot \beta \cdot f = 5,82 \cdot 10^{-7} \cdot 22 \cdot 10 \cdot 25$$

$$= \underline{\underline{0,0032 \text{ m/s} < 0,15 \text{ m/s}}} \quad \checkmark$$

Checking the p · V-value:

$$pV = p \cdot V_m$$

$$pV = 18,66 \cdot 0,0032$$

$$= 0,06 \text{ N/mm}^2 \cdot \text{m/s} < 0,5 \text{ N/mm}^2 \cdot \text{m/s} \quad \checkmark$$

$$p = k \cdot \frac{P}{C} = 50 \cdot \frac{5000}{13400} = 18,66 \text{ N/mm}^2$$

Nominal service life:

$$G_h = C_1 \cdot C_2 \cdot C_3 \cdot \frac{5}{d_3 \cdot \beta \cdot f} \cdot \frac{C}{P} \cdot 10^6$$

$$G_h = 0,25 \cdot 1,0 \cdot 12 \cdot \frac{5}{22 \cdot 10 \cdot 25} \cdot \frac{13,4}{5,0} \cdot 10^6$$

$$= \underline{\underline{7308 \text{ h} > 7000 \text{ h}}} \quad \checkmark$$

Where: C<sub>1</sub> = 0,25 (alternating load direction, f = 25 rpm < 30 rpm)

$$C_3 = C_2 \cdot \frac{C}{P} = 1,0 \cdot \frac{13,4}{5,0} = 2,68$$

See alignment chart (on page 118) C<sub>3</sub> = 12

Where: d<sub>3</sub> = 22  
 f = 25 rpm  
 β = 10° (half the swivelling angle 20° = 10°)  
 C = 13,4 kN  
 P = 5,0 kN

**Low cost rod ends load ratings**

The ultimate radial static load rating is measured as the failure point when a load is increasingly applied to a pin through the rod end's bore and pulled straight up while the rod end is held in place. Note that the actual rating is determined by calculating the lowest of the following three values:

1: Raceway material comprehensive strength (R value):

$$R = E \times T \times X$$

2: Rod end head strength (H value, cartridge type construction):

$$H = \left[ \left( \frac{T}{2} \sqrt{D^2 - T^2} \right) + \left( \frac{D^2}{2} \times \sin^{-1} \frac{T}{2} \right) - (\text{O.D. of Bearing} \times T) \right] \times X$$

Angle of  $\frac{T}{2}$  expressed in radians

3: Shank strength (S Value) male threaded rod end:

$$S = [(\text{root diameter of thread}^2 \times .78) - (N^2 \times .78)] \times X$$

female threaded rod end:

$$S_2 = [(J^2 \times .78) + (\text{major diameter of thread} \times .78)] \times X$$

- Where: E = Ball diameter  
 T = Housing width  
 X = Allowable stress  
 D = Head diameter  
 N = Diameter of drilled hole in shank of male rod end  
 J = Shank diameter of female rod end

The axial static load capacity is measured as the force required to cause failure via a load parallel to the axis of the bore. Depending on the material types and construction methods, the ultimate axial load is generally 10-20% of the ultimate radial static load. The formula does not account for the bending of the shank due to a moment of force, nor the strength of the stake in cartridge-type construction.

Axial strength (A Value):

$$A = .78 [ (E + .176T)^2 - E^2 ] \times X$$

- Where: X = Allowable stress (see table below)  
 E = Ball diameter  
 T = Housing width

Material	Allowable stress (PSI)
300 Series Stainless Steel	35,000
Low Carbon Steel	52,000

### Operating temperatures

Heavy-duty ball and roller bearing rod ends can be used for operating temperatures between  $-20^{\circ}\text{C}$  and  $+120^{\circ}\text{C}$ . The temperature range of heavy-duty rod ends with integral spherical plain bearing is between  $-30^{\circ}\text{C}$  and  $+60^{\circ}\text{C}$ , without affecting the load capacity. Higher temperatures will reduce the load capacity taken into account for the calculation of the 'working life' under the temperature factor  $C_2$  on page 116.

### Loads

The decisive parameters for the selection and calculation of heavy-duty rod ends are size, direction and type of load.

### Radial or combined loads

The heavy-duty rod ends have been especially designed to cope with high radial loads. They can be used for combined loads, the axial load share of which does not exceed 20% of the corresponding radial load.

### Unilaterally acting load

In this case the load acts only in the same direction, which means that the load area is always in the same bearing section.

### Alternately acting load

In case of alternating loads, the load areas facing each other are alternately loaded and/or relieved, which means that the load changes its direction constantly by approximately  $180^{\circ}$ .

### Swivelling angle

The swivelling angle is the movement of the rod end from one final position to the other. Half the swivelling angle  $\alpha^{\circ}$  is used to calculate the service or 'working life'.

### Angle of tilt

The angle of tilt, also called setting angle, refers to the movement of the joint ball and/or the inner ring to the rod end axis (in degrees). The tilting angle (a) indicated in the table for the heavy-duty ball and roller bearing rod ends corresponds to the maximum possible movement being limited by the shields on both sides. It is important that this tilting angle is not exceeded either during installation or operation, as otherwise the shields may be damaged. For heavy-duty plain bearing rod ends a distinction is made between the tilting angles (a1 and a2).

If the movement is not limited by adjacent components, then angle a1 can fully be used without affecting the rod end capacity. Tilting angle a2 is the movement limit when connecting a forked component.

### Nominal service life

The term 'nominal service life' is used for heavy-duty ball and roller bearing rod ends and represents the number of swivelling motions or rotations and/or the number of service hours the rod end performs before showing the first signs of material fatigue on the raceway or roller bodies. In view of many factors that are difficult or impossible to assess, the service life of several apparently identical bearings differ under the same operating conditions.

For this reason, the following method for the service life determination of heavy-duty ball and roller rod ends results in a nominal service life being achieved or exceeded by at least 90% of a large quantity of identical rod ends.

### Working life

The term 'working life' is used with heavy-duty plain bearing rod ends. It represents the number of swivelling motions or rotations and/ or the number of service hours the heavy duty plain bearing rod end performs before becoming unserviceable due to material fatigue, wear, increased bearing clearance or increase of the bearing friction moment.

The 'working life' is not only influenced by the size and the type of load, it is also affected by a number of factors, which are difficult to assess. A calculation of the exact service life is therefore impossible. Field-experienced standard values for the approximate 'working life' can nevertheless be determined by using the following calculation procedure which is based on numerous results from endurance test runs and values from decades of experience. The values determined by this formula are achieved, if not exceeded, by the majority of the heavy-duty rod ends.

### Load

The load capacity of the maintenance free bearing element parts is very high at normal ambient temperatures. These bearings absorb high forces and weigh only one fifth of traditional, metal bearing housings. The excellent dampening properties are based on the fact that the polymer material of the two part bearing can absorb vibrations differently than steel.

However, plastic specific properties, such as dependence on temperature and behaviour under long term stress must be taken into consideration when using these bearings.

The load capacity of the rod end bearing should therefore be checked in a practical test, particularly if it will be used under continuous high loads and at elevated temperatures.

### Chemical resistance

The moisture absorption is approximately 1.3% of weight in standard atmosphere.

The saturation limit in water is 6.5%. This must be taken into account for these types of applications. The housing made of igumid G is resistant to weak alkalines, acids and fuels, as well as all types of lubricants.

**- not resistant.**

All data given at room temperature (20°C).

### Radiation resistance

Self aligning plain bearings are resistant to radiation up to an intensity of  $3 \times 10^2$  Gy.

### Application temperatures

These bearings can be used in temperatures from  $-30^\circ\text{C}$  to  $+80^\circ\text{C}$ . The table below shows the effect of temperature on the load capacity of the bearings.

Minimum	$-30^\circ\text{C}$
Maximum, long term	$-80^\circ\text{C}$
Maximum, short term	$+120^\circ\text{C}$

### Coefficients of sliding friction and speed

One important advantage of plastic spherical bearings is that rapid, rotary movements of a mounted shaft take place directly in the spherical portion. In metallic rod ends, rotary motion takes place between the race and the spherical bearing. High speeds can be achieved with plastic bearings.

These bearings are used in such a way that the angular movements of the spherical bearings take place at the outer diameter. By contrast, rotations of the shaft are supported directly in the I.D. of the spherical portion. The advantage therefore lies in the polymer vs. steel relationship. Polymer produces lower friction and permits high speeds, even when running dry.

### UV resistance

The corrosion resistance of these bearings makes them very useful for outside applications. They are permanently resistant to UV radiation. A small change in colour (dark colouration) of the spherical ball due to UV radiation does not affect the mechanical electrical or thermal properties.

BALL & SOCKET JOINTS

### Material

Yellow zinc plated steel.

### Technical Notes

Quick disconnect ball joints are used in light duty applications where the ball stud

needs to be easily disconnected from the housing. This is accomplished simply by pulling the ball stud out of the housing, (takes approximately 10 to 20 pounds of

force to remove the ball stud). Quick disconnect ball joints are typically assembled in push-pull cables or rod linkages.

### Material

Steel, (silver zinc plated). Brake piece technopolymer (polyamide PA).

### Technical Notes

The clamping nut can be set to give a

required thrust on the Belleville spring washers, in order to increase resistance to the movement of the ball stud, the spring washers act as safety washers for the

screws.

Once the max. thrust to the spring washers is reached the ball stud is firmly fixed in position.

# Spiral Beam Coupling - Stainless Steel

set screw - long type

Flexible Couplings

**R3002.1**

FLEXIBLE COUPLINGS

**Material**

Stainless steel, SUS303

**Technical Notes**

Zero backlash.

The flexure allowed by the beam portion of the coupling is capable of accommodating

parallel, angular and axial misalignment. High wrench torque rigidity and sensitivity. Rotation character of clockwise or anti-clockwise are exactly the same. Free maintenance, oil-resist and anti-

corrosiveness. Offset of angular, parallel or axial deviation are individual allowed value, so couple reasons of axial offset appearing at the same time would reduce unit allowable value.

Flexible Couplings

**R3005.2**

FLEXIBLE COUPLINGS

**Material**

Anodized aluminium AL7075

**Technical Notes**

The flexure allowed by the beam portion of the coupling is capable of accommodating

angular, parallel and axial misalignment. Free maintenance, oil-resist and anti-corrosiveness. Rotation character of clockwise or anti-clockwise are exactly the same.

Offset of angular, parallel or axial deviation are individual allowed value, so couple reasons of axial offset appearing at same time would reduce the unit allowable value.

### R3064

#### Material

Mainframe: Anodized aluminium - AL 7075  
 Disk: Stainless steel - SUS303

#### Technical Notes

High wrench torque load, high wrench torque rigidity capacity and excellent sensibility.

The flexure allowed by stainless steel disc portion of the coupling is capable of accommodating angular, parallel and axial misalignment. Teethless screw to lock disks, zero backlash Clockwise character is exactly the same as anti-clockwise one.

Free maintenance, oil-resist and anti corrosiveness. Offset of angular, parallel or axial deviation are individual allowed value, so couple reasons of axial offset appearing at same time would reduce the unit allowable value.

### R3066.1

#### Material

Main frame: Anodized aluminium AL7075  
 Disk: Stainless steel SUS301  
 Pin: Stainless steel SUS303

#### Technical Notes

High wrench torque load, high wrench torque rigidity capacity and excellent sensibility.

The flexure allowed by stainless steel disc portion of the coupling is capable of accommodating angular, parallel and axial misalignment. Teethless screw to lock disks, zero backlash. Clockwise character is exactly the same as anti-clockwise one. Free maintenance, oil-resist and anti

corrosiveness. Offset of angular, parallel or axial deviation are individual allowed value, so couple reasons of axial offset appearing at same time would reduce the unit allowable value.

RIGID COUPLINGS

### R3230

**Material**  
Steel.

**Technical Notes**

Economical, quick installation, compact size.

Tolerances: Inner diameter h8, outer diameter H8.

Surface Roughness: Rt max. 16µm, Ra 3µm

**Tips**

Do not use any oil with molybdenum bisulphide, high pressure additives, or grease as these reduce the coefficient of

friction.

Max Torque (Mt) and Axial Thrust (Fa) values are only valid if standard oils are used.

**Important Notes**

**Assembly:**

Carefully clean the hub and shaft contact surfaces and apply a film of lightweight oil. Slide the locking assembly into the hub bore, insert the shaft and tighten gradually in cross sequence to indicated torque.

When tightening the mounting screws the hub has slight axial movement with respect to the shaft.

**Dismantling:**

Gradually loosen the cap screws. Remove and re-insert the correct number of screws into the jacking holes and tighten gradually and regularly in crossed sequence until the back cone is released.

If the element is to be re-used then re-lubricate screws and threads.

Then tighten gradually and regularly in cross sequence to indicated torque.  
When tightening the mounting screws the hub has NO axial movement with respect to the shaft.  
**Dismantling:**  
Loosening the cap screws normally releases the unit.  
In case of difficulties slightly hammer the released screws to push back the rear pressure cone.

RIGID COUPLINGS

### R3234

**Material**  
Steel.

**Technical Notes**

Capable of withstanding bending movements. Compact size.  
Shaft & hub surface roughness: Rt max. 16µ, Ra 3µ

**Tips**

Do not use any oil with molybdenum bisulphide, high pressure additives, or grease as these reduce the coefficient of friction.  
Max torque (Mt) and Axial thrust (Fa)

values are only valid if standard oils are used.

**Important Notes**

**Assembly:**  
Carefully clean the hub and shaft contact surfaces and apply a film of lightweight oil. Slide the locking assembly into the hub bore, insert the shaft and tighten gradually in cross sequence to 50% of torque value indicated in table. Repeat the same operation by tightening all screws to rated torque.

Re-check screws are tightened up to torque value in the table.

**Disassembly:**

Loosen the cap screws. Insert the screws into the dismantling threading and tighten gradually and regularly in crossed sequence up to 50% of torque value indicated in the rating table.  
When the front cone is loose, to release the rear cone keep tightening the screws and repeat the sequence above.

## R3220

### Material

Stainless steel (A2, AISI 303).

### Technical Notes

Used to easily and effectively achieve shaft/hub joints. Simple axial and radial fixing.

For applications such as fixing sprockets, gears, pulleys, cams, levers on to shafts.

### Tips

Clean shaft and hub free from oil and dirt. Rotate the nut until inner part protrudes approximately 3mm over the outer.

Install taper bush onto shaft, slightly tighten nut when located in desired position.

Compensate the axial off-set produced with a soft-faced mallet, and tighten.

### R3210

#### Material

Steel (AISI 12L14), black oxide finish, or stainless steel (A2, AISI 303). Other materials available on request.

#### Technical Notes

Design fully engages the shaft without

marring or damaging.

Two piece collars are easily installed where major disassembly would otherwise be required.

Greater axial holding power than set screw collars, effective on hard and soft shafts.

#### Important Notes

Different bore sizes available on request. For keyways, please add „-KW“ suffix when ordering.

# Spur Gears - Module 1

carbon steel - 14-120 teeth

**R5179**

STANDARD SPUR GEARS

**Material**

Carbon steel (ISO C45). Accuracy to JIS B 1702-1 (ISO) class 8, induction hardened class 9.

**Technical Notes**

20° pressure angle, full depth tooth.  
Amount of backlash when assembling

gears=0,04- 0,10 mm.

**Tips**

Module 1 for gears with 8-10 teeth see R5175 & R5176, for gears with 12-18 teeth see R5177, for gears with 14-120 teeth without screw see R5179. Max. allowable torque (Nm) is based on standard opera-

ting conditions (see technical pages) with a safety factor of 1.2. For non standard applications apply a suitable safety factor depending on frequency of use, type of working etc.

### R5180

#### Material

Carbon steel (ISO C45).  
Accuracy to JIS B 1702-1 (ISO) class 8- 9.

#### Technical Notes

20° pressure angle, full depth tooth.  
Amount of backlash when assembling gears = 0,05 - 0,125mm.

#### Tips

Module 1.25 for gears with 8-11 teeth see R5181, for gears with 8-10 teeth see R5180, for gears with 12-17 teeth see R5183, for gears with 18-120 teeth see R5185.  
Max. allowable torque (Nm) is based on

standard operating conditions (see technical pages) with a safety factor of 1.2. For non standard applications apply a suitable safety factor depending on frequency of use, type of working etc.

# 1,0 to 0,5 Module Anti-backlash stainless steel or aluminium pin hub

**R2080**

STANDARD SPUR GEARS

### Material

Stainless steel (DIN 1,4305) or aluminium (DIN 3,1355 anodized before cutting).

### Technical Notes

20° pressure angle, zero backlash.  
Quality class DIN 7, AGMA 10.  
The split gear design incorporates springs

which force the floating gear in a direction opposite to the rotation of the fixed gear, effectively enlarging the teeth width and overcoming the space, or backlash, between the teeth of the gear. Two types of design, one utilising scissor springs (figure

1), and the second, for larger diameter gears, utilising extension springs (figure 2).

### Tips

Special versions available on request (e.g. different number of teeth, 14,5° pressure angle etc).

Flexural pivot bearings are limited rotation bearings for applications that do not allow lubrication but also require precision, repeatability and infinite life.

Angle of rotations are graded into three series:

- Series 10 -  $\pm 15^\circ$  (mainly for light loads)
- Series 20 -  $\pm 7.5^\circ$  (mainly for medium-heavy loads)
- Series 30 -  $\pm 3.7^\circ$  (mainly for heavy loads)

They have a range of torsional stiffness depending on the bearing diameter. The bearing consists of two stainless steel sleeves held in position by three leaf springs on two planes. There is no contact between the sleeves (eliminating friction) and the springs provide the pivotal action which is inherently self centring and requires no lubrication.

#### Material

The sleeves in a Flexure Pivot bearing are made from 416 Stainless Steel. The spring and core are made from Stainless Steel (410 and 420) with a braze alloy (AMS4765).

Special pivot bearings can be manufactured with angle of rotation up to  $\pm 50^\circ$  and for heavy loads.

#### Single Ended Pivot Bearings

Here one end is fixed and the other end is free to rotate - this type is used most widely as they support overhung loads.

Single Ended Pivot Bearings are frictionless with infinite life (see our technical graphs for life cycle curves).

#### Double Ended Pivot Bearings

In these applications both ends are fixed and the centre of the bearing is free to rotate - this supports suspended loads.

Double Ended Pivot Bearings are frictionless with infinite life (see our technical graphs for life cycle curves).

The cycle life of the bearings is based on the fatigue limit of the springs. The graphs below show the life expectancy for Torsional Spring Rates for Series 10, 20 and 30. Max  $\theta$  shows the angle of deflection. This is the deflection angle from the null position, which can be positive or negative.

Series 10 - Max  $\theta \pm 15.0^\circ$

Series 20 - Max  $\theta \pm 7.5^\circ$

Series 30 - Max  $\theta \pm 3.7^\circ$

# Flexure Pivot Bearings from Automotion Components

FLEXURE PIVOT BEARINGS

	Application	Notes
	Gimbals	Free from backlash, friction and wear. Flexure bearings give the extreme accuracy needed for positioning precision optics.
	Oscillating mirrors	Optical scanners using flexure bearings provide for the ultimate in cost-effective design. They allow for easy assembly and, with indefinite life expectancies, perform with undiminished accuracy.
	Tensioners	Belt or chain tensioning can be easily achieved through the use of flexure bearings. Tolerant of hostile environments and not subject to wear, extreme long life can be expected without maintenance.
	Linear positioners	Free of errors due to backlash, friction or wear, flexure bearings mounted in suitable geometric structures can provide accurate linear movement or adjustment.
	Lever actuators	Accurate motion requirements in areas of contamination, temperature extremes, or in a vacuum, can be easily provided through linkages utilising flexure bearings. Used in dynamic conditions, the precision of load sensitive systems can be increased to a much higher level than with ball bearings.
	Restrained or dampened oscillating motion	Eccentric or circular oscillating mechanisms can utilise Flexure bearings to provide centre and dampening actions for a lifetime of maintenance free performance.
	Gauges sensors	Miniature sizes which are free of error from backlash, friction or wear, make flexure bearings ideal for applications where position must be accurately measured or outside forces sensed.
	Vibrating/sorting mechanisms	A workhorse, capable of supporting heavy loads for years of continuous service without wear or deterioration, Flexure bearings are ideal for equipment such as vibrating hoppers operating in severe environments.
	Optical or magnetic disc read/write heads	With their constant predictable spring rate, Flexure bearings are immune to the problems of starting vs. moving torque requirements of conventional bearings. Also since they operate without backlash errors or wear, a lifetime of accurate performance can be expected.

The following examples are a few of the possible methods for installing standard flexure bearings. Other techniques may provide satisfactory results. Special options, such as flanged or drilled and tapped sleeves may be provided upon request. Please contact our Technical Department with any questions or for a review of mounting requirements.

**Set screw**

One or more properly sized cup point set screws may be used to clamp the bearing in place. Hole size should be 0.0005" to 0.0010" larger than the bearing.

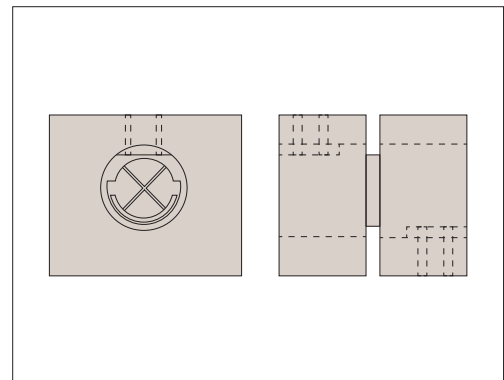

**Clamp screw**

A clamping screw applies suitable pressure to retain the bearing in place. Hole size should be 0.0005" to 0.0010" larger than the bearing.

**Radial or axial pins**

Pins may be pressed into holes drilled through the mounting bracket and the bearing sleeve. Care must be exercised to orientate the bearing properly so the springs are not damaged. Hole size should be 0.0005" to 0.0010" larger than the bearing.

**Locator flats**

Locator flats with cup point set screws may be used to orientate and securely clamp the bearing in place. Hole size should be 0.0005" to 0.0010" larger than the bearing.

Flexure Pivot Bearings from Automation Components

The linearity of the bearings (being the rotational deflection of the pivot v the torque required to induce the deflection) is relatively constant for angles of rotation up to 15°. We define hysteresis as the difference between the zero position when the bearing is deflected to a plus angle then relieved and then deflected to a negative angle then relieved. Comparing these two positions is the angle of hysteresis (see graphs below).

Series 10 - Max.  $\theta \pm 15.0^\circ$

Series 20 - Max.  $\theta \pm 7.5^\circ$

Series 30 - Max.  $\theta \pm 3.7^\circ$

The rotation of the bearing sleeve segments is achieved by bending flat spring beams. This causes a slight radial shift in the sleeve segment. For small angle of rotations (eg 2°) the shift is minimal (around 0.2% of the bearing diameter). However this can increase up to 1% of the bearing diameter at a rotation of 15° (see graph below).
